A MODEL FOR THE CROSS CULTURAL INTERACTION
TRAINING OF ADULTS

Richard Allin McGonigal

ABSTRACT

A MODEL FOR THE CROSS CULTURAL INTERACTION
TRAINING OF ADULTS

By

Richard Allin McGonigal

Drawing from the findings of Peace Corps trainers,
military advisors and those agencies sponsoring personnel
attempting cross cultural interaction overseas and/or
domestically, this study sought to isolate the personal
interaction variables having the most influence upon success-
ful communication. These variables, in order of importance,
were found to be: self awareness, empathy, tolerance for
ambiguity, self esteem, low dogmatism, high regard for the
value of equality, the ability to communicate non-verbally,
genuineness, warmth and openness.

Sampling from a population of Michigan State University,
College of Education, students (n=288) interested in working
in the inner city a ten-week training model was designed
and tested for its effect upon 14 factors deemed to be im-
portant in interpersonal communication. The treatment con-
sisted of an encounter group mode which included a series of
human relations exercises. Instruments used to test the
variables included: Rokeach's Value Inventory and D Scales,

Richard Allin McGonigal

Hunt's Low Self Esteem Scale, the Truax Scales for Empathy, Genuineness, Warmth and Openness, Budner's Scale for Intolerance for Ambiguity, a congruity use of the Traux Scales for Self Awareness, and a non-verbal communication scale designed by the author.

Treatment versus control group analyses and repeated measures analyses showed significant treatment effects. Those variables most sensitive to treatment were (in order of strength): increased self awareness, reduced dogmatism, higher regard for the value of equality, increased empathy, increased self esteem and increased tolerance for ambiguity. An analysis of relationship between leadership style and group mean behavioral changes (using Wile's Group Therapy Questionnaire--Form C) showed no significant correlations between leadership style and group performance within this training model.

ACKNOWLEDGMENTS

Jane, my wife, George and Peggy, my children, are first in line for my salute of appreciation. Their patience with a husband/father who has been going to school "forever" is gratefully received.

In the early years of data gathering and model testing I was helped enormously by the direction and support of Lt. Gen. Victor Krulack, USMC, and General Lewis Walt, USMC. The officers and men of the Third Marine Amphibious Force own my lasting gratitude for their help and cooperation.

Professor Russell Kleis, my advisor at Michigan State University, more than earned his reputation as a scholarly, warm human being. I especially appreciate the freedom he allowed me to venture out into what I most wanted to study. I am enriched by his philosophy of education.

Professor Ted Ward was perhaps the closest to my work in his capacity as Director of the Human Learning Research Institute. He risked a great deal in sponsoring the courses I taught. Not everyone would put his name beside such attempts at affective learning. His trust proved a great motivator. The support of the Institute in providing video-tape equipment, office space and services is especially appreciated. Miss Diane Giebel and Mrs. Florence Nurse,

secretaries there, more than once worked miracles to keep the project alive.

Professor Hideya Kumata was especially helpful in broadening my theoretical understanding of cross cultural communication. I shall be forever indebted to him for his introduction to Claude Levi-Strauss.

Professor Alex Cade deepened my appreciation for the richness of the human personality. His guidance on personality assessment proved most rewarding. Perhaps it was his own awe, yes--reverence, toward human personality that strengthened my belief in people to adequately put their own affairs in order and to seek a deeper union with others.

I am indebted to Professors Milton Rokeach and Everett Rogers for their stimulation and solid exposure to the fundamental research in attitude change and the diffusion of innovations. The caliber of their scholarship remains a lasting ideal.

I am especially indebted to my fellow students who assisted me in this project. Many acted as "facilitators" in the small groups we "taught". Bill Arnet, Dick Ayling, Bill Babcock, Nancy Carlson, Cathy Champion, Peggy Chase, John Dettoni, Bob Dunn, Gary Ebrecht, Baiba Gilbe, Phyllis Good, Florence Hoffman, Wayne Hunter, Jim Jackson, Beatrice Clark-Jones, Leslie June, Margie Kaplan, Krista Kaul, Jan Krulick, Chris Larsen, Molly Laula, Nancy Leatherman, Lee Leininger, Gregory Lubkin, Penny Lynch, Freddie Martin,

constant willingness to stop what they were doing and to offer advice.

I am most grateful to Professor Norman T. Bell for his advice with the IBM 1130. Words of thanks should be expressed here for the Research Consultant Office which made possible some time on the CDC 3600 Computer.

Naturally, it would have been impossible for me to be expressing gratitude to the above if the United States Navy and our Chief of Chaplains, Rear Admiral Francis Garrett, had not granted me study leave to attend Michigan State University. Again, only time will tell if their rather brash risk will be justified as I return to duty. It is, after all, the thought of our Navy and Marine Corps men and women, along with their families and their interaction overseas and at home that motivated this study and makes me anxious to return to a role in which I may be "useful".

CHAPTER I

STATEMENT OF THE PROBLEM

This study concerns the personal interaction of change agents with their clientele. Our focus is upon that interaction--not the declared purposes or the eventual changes wrought. Change agents in this study include teachers, police, Peace Corps Volunteers and military personnel-- anyone sent to a new culture to provide a specific service by a sponsoring agency. As important as it may be, this study is not concerned with tourism or non-purposeful inter- action.

The central problem of change agents venturing into new cultures is one of heterophily. Be it United States Marines trying to pacify a besieged area, teachers from the suburbs attempting to teach in the inner city or police trying to disperse a mob of protestors--these people have one common problem. They are heterophilous from the clientele among whom they work.

Heterophily, once used only in botanical nomenclature to describe plants which contained at least two different shaped leaves springing from the same branch, is more and more being used by communication specialists and community

development theorists. In its social use, it implies a con-
dition of "differentness" between change agents and their
target populations. Homophily is the condition wherein
change agents share "sameness" with their clientele.[1]

Heterophily has its social roots in the slang of Ancient
Greece. ʽΕτεροφῶνος (hetero-pho-nos) meant that someone spoke
with a different speech or tone of voice.[2] If a man were
called " ʽετεροφῶνος" it meant that he was of a barbarous sort.
The Greeks also used words like ʽετεροτρόπος (hetero-tro-pos)
which meant someone of a different life-style and ʽετερομῆτορ
(hetero-may-tor) which meant someone born of a different
mother than the rest of the children in the family.

Perhaps the early Greeks were especially sensitive to
the shades of racism. The ideal was apparently to be
ʽομοφῶνος i.e., of the same race or people. If one were to
be ʽομοφωνέιν he would speak with the same language, chime in
with the "in" group.[3]

So the two extremes are heterophily (a state of dif-
ferentness) and homophily (a condition of sameness or one-
ness). We are concerned with sending change agents into
heterophilous environments and so equipping them with

---

(New York: Holt, Rinehart and Winston, 1969), p. 181.

[2]Liddell and Scott, Greek-English Lexicon (London:
Clarendon Press, 1949), p. 277.

[3]Ibid., p. 489.

learning skills that they may act among their counterparts in a more homophilous manner.

The "crunch" or the biting edge of this problem--as we shall point out in chapter two--is not so much that our change agents are heterophilous from their clientele (they will be so of necessity). The problem is brought to a head <u>when change agents reveal their heterophily in a contemptuous manner</u>. We can seldom bear with someone who is different <u>and</u> contemptuous of our culture or our life style.

Some brief examples may illuminate the concept of heterophily in its most unpleasant form, i.e., contemptuous heterophily.

In 1967, an American firm sent a team of social scientists to South Vietnam to train Vietnamese graduate students in projective techniques so that an important value study might be conducted. In less than three months the graduate students petitioned the United States Embassy that the visas of these social scientists be withdrawn. The students resigned from their sorely needed employment rather than put up with what they perceived as contempt.[1] That these scientists would not eat with the students, use the same lodgings or mix with them socially was perceived by the students as being deliberately insulting. The scientists left the country feeling hurt and misunderstood.

---

[1]R. A. McGonigal, "Uses of Cross Cultural Attitude Research in Southeast Asia," a paper delivered at the 1969 Annual Meeting of the American Psychological Association Washington, D. C.

Information Minister for the Republic of South Vietnam,
Ton That Thien, put the problem quite succinctly.

> The intrusion of the United States in Vietnam has
> had a far greater impact on Vietnam than did the
> previous dominance of France, which ended in 1954 after
> the French-Indo Chinese war. The American value--
> rejection of authority, the equation of success with
> wealth, the insistence on ruthless efficiency--combined
> with American political dominance have produced an
> explosive threat on Vietnamese culture. The French
> were never dominated by the crusading spirit which domi-
> nated Americans. The French always had a certain
> admiration and respect for Vietnamese culture which was
> absent from the Americans. . . . As long as America
> persists in its present course, Vietnamese nationalists
> can do nothing but wait and pray--realizing that the
> hour is late, that Vietnamese society may soon be past
> saving and that Communists and Americans may wind up
> contending for sterile victory over a wasteland.[1]

Back in our own land the heterophily problem is perhaps

most easily seen in inter-racial conflicts. Well-meaning

white Americans sometimes penetrate our ghettos to teach, to

ply their skills as social workers or youth leaders. More

often than not they experience deep frustration because

their efforts do not seem to be welcomed. More often than

not white Americans fail to see how "sick" a word is the

word 'help'. Few of us see the full import of what Stokely

Carmichael has been saying,

> . . . that is what white American is going to learn.
> They cannot _give_ us anything. No white liberal can
> give me anything. The only thing a white liberal can
> do for me is to help civilize other whites, because
> they need to be civilized.[2]

tion: The Dialectics of Liberation_, David Cooper, Ed.
(New York: The Macmillan Company, Collier Books, 1968), p. 159.

This is not to say that there is no work room left for whites in our inner cities. It is to say that whites shall require increased sophistication in interpersonal skills if they are to make meaningful contributions in their work there.

Now, how to bridge the gap? This is the problem vexing Peace Corps trainers, inner-city police departments, educators of teachers, and those responsible for training military men to pacify areas and conduct civic action among people of other cultures.

Selection has long been the chief means of finding the best possible change agents to work in new cultures or sub cultures. Using various criteria, sponsoring agencies have sought about among applicants for the people who would seem to adjust most readily to new environments. Selection processes have been tightened as empirical research has been employed to correlate selection norms with behaviors in the field. This is to be heralded. But not every agency is in a position to be choosy about whom they send abroad or into the ghetto. There are not always enough volunteers who are suitable. Therefore, something beyond selection is required.

Thus far, little attention has been paid to another means of reducing the heterophily gap between change agents and their clientele--namely, pre-deployment training (see Figure 1-1 on the following page).

The central tasks of this study are: (1) to design a training model and (2) to assess any changes which may take
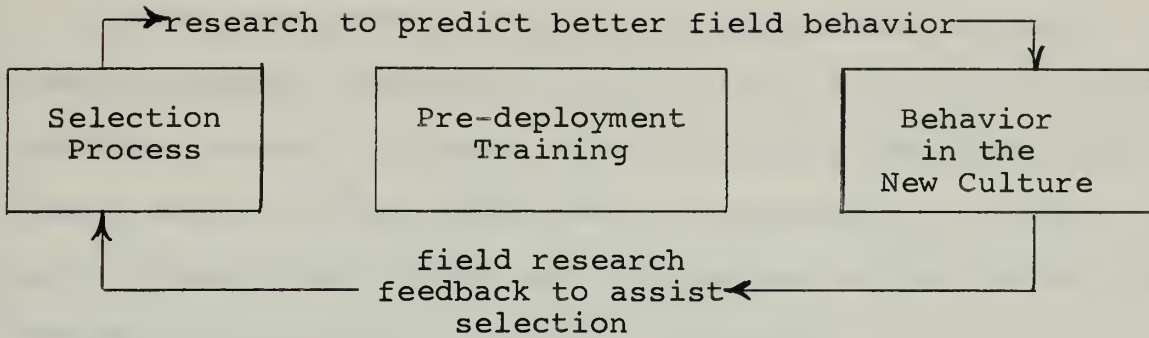

FIGURE 1-1. Flow of previous cross cultural research.

place in trainees exposed to the training model as a basis
for postulating probable outcomes within the pre-deployment
training phase if it were to be undertaken using such a model.

We have tried, along with those concentrating upon se-
lection procedures, to define those behaviors which are cen-
tral for reducing heterophily. We have selected or designed
learning experiences to improve interpersonal skills and
attitudes in direct association with those desired behaviors.
We have attempted to measure (pre vs. post and treatment vs.
control) these key variables in the training experience.

Both those in charge of selecting change agents and
those attempting to train change agents have for many years
used the classical norms of language facility and area knowl-
edge as their key training variables. From our review of
the literature (see chapter three), many conversations with
Peace Corps trainers, our own research overseas and our
experience in training police and teachers for work in the
inner city, we felt that these were important variables but
certainly not either paramount or sufficient to successful
adjustment.

Basic interpersonal skills have been added to many training models, including this one. It is our feeling that knowing a country's history or a minority's language is not nearly enough for the reduction of heterophily. We look upon interpersonal skills and awarenesses as the crucial link between change agents and their clientele.

Specifically, the variables we have centered upon in the cross cultural training model in this study are the following:

1. Increased self-awareness

2. Increased self-esteem

3. Increased regard for the value of equality

4. Reduced dogmatism

5. Increased tolerance for ambiguity

6. Increased empathy as viewed by the individual

7. Increased empathy as viewed by one's counter-parts

8. Increased genuineness as seen by the individual

9. Increased genuineness as judged by one's counter-parts

10. Increased warmth as felt by the individual

11. Increased warmth as experienced by one's counterparts

12. Increased openness as known by the individual

13. Increased openness as received by one's counterparts

14. Increased non-verbal communication skills

It seemed possible _and_ appropriate to collapse these fourteen variables into two general, desired characteristics:

    (1) Increased awareness of one's self and how
        he is being perceived by his counterparts.

    (2) Tolerance for ambiguity and relaxed, confident
        feeling about one's self and the process of
        human interaction.

That our ambassadors overseas and our change agents at home have too frequently lacked these characteristics will hopefully be demonstrated in chapter two. Research relevant to the heterophily problem and to the above variables is discussed in chapter three. The theoretical basis and the design of our cross cultural interaction training model are described in chapter four.

Perhaps we would do well at this point to pause for some working definitions of key interaction factors and of those variables which are of central interest in the training model which has been developed and tested.

Some Problem Factors	Variables of Interest in the Model
1. Condescension	1. Dogmatism
2. Contempt	2. Empathy
3. Culture Shock	3. Genuineness
4. Entropy	4. Tolerance for Ambiguity
5. Goal Dissonance	5. Non-verbal Communication Skills
6. Heterophily	6. Openness
7. Kinesics	7. Regard for the Value of Equality
8. Noise	8. Self Awareness
9. Patronization	9. Self Esteem
10. Proxemics	10. Warmth

First, let us take a look at our problem factors--those manifestations of cross-cultural confusion which need crisp working definitions.

1. Condescension is communication in which the originator implies a status hierarchy of superior toward inferior in which he is the superior.

2. Contempt in this study is meant to describe all verbal and non-verbal actions which evoke humiliation and resentment in the receiver.

3. Culture Shock is the anxiety produced from loss of familiar cues when one tries to penetrate a new culture. It ranges from malaise to such complete immobilization that the change agent must be recalled from his work.

4. Entropy is a "shuffledness" of communication in which the expectations of sender and receiver are never completed, cues are inappropriate and usually misread.

5. Goal Dissonance is the condition in which the sponsoring agency, the change agent and the clientele are having serious differences in the perceived goals of their interaction.

6. Heterophily is the condition of being so "different" from one's counterpart that authentic communication is almost bound to be difficult.

7. Kinesics are those facial and body movements which non-verbally and either intentionally or unintentionally transmit messages. Some cross cultural misunderstandings occur when kinesics are culturally specific and not understood

by one's counterpart. For example, a crooked finger is an invitation in one culture and an insult in another.

8. <u>Noise</u> as used herein refers to static, overloading of other stimuli and general interference with communication.

9. <u>Patronization</u> is a relationship in which one party does things for, protects or assumes responsibility for another party. It is usually resented by the party being patronized.

10. <u>Proxemics</u> refers to the growing area of knowledge about social distance and spatial rules of interaction. Few of those spatial rules are transcultural and they must be discovered and incorporated in most cross cultural interaction.

Working definitions for variables of interest in our cross cultural interaction training model are as follows:

1. <u>Dogmatism</u> is the degree of rigidity with which one clings to opinions, beliefs and attitudes.

2. <u>Empathy</u> is the ability of one party to recognize and respond accurately to another party's feelings seriously and in depth.

3. <u>Genuineness</u> as used here refers to the congruity of one's inner feelings with those which are outwardly communicated. Masks, roles, double messages and facades are usual indications of low genuineness.

4. <u>Tolerance for Ambiguity</u> is defined as the tendency to perceive ambiguous situations as non threatening.

Situations viewed as novel, complex or insoluble are seen as tolerable or even desirable by some and intolerable by others.

5. <u>Non-verbal Communication Skills</u> are those arrays of facial and gestural activities which aid and sometimes replace verbal communication.

6. <u>Openness</u> as used in this study refers to the amount of feeling and judgment which one reveals to others. It involves openly expressing and assuming responsibility for feelings and judgments.

7. <u>Regard for the Value of Equality</u> is perhaps best judged by a person's overt acts toward his neighbors. However, in this study, we are especially interested in where the person places equality among his hierarchy of other values, as listed in a twelve-item inventory.

8. <u>Self Awareness</u> as used here refers to the degree of congruence between what a man perceives others to feel toward him and what others actually feel toward him (Traux, 64).

9. <u>Self Esteem</u> also is a congruence factor. In this case, it involves the degree of congruence between one's perceived self worth and his ideal self. It is a case of inner congruity (Cade, 70).

10. <u>Warmth</u>, in this study, refers to positive regard exhibited toward others. The key dimension is the amount of unconditional acceptance of others.

These, then are some of the working definitions which we have used in this study. Their theoretical bases are discussed in Chapter Three.

In summary, the central problem addressed in this study is that of contemptuous heterophily as exhibited by change agents in a new culture. We have drawn together the above listed factors and variables into a synthesis, i.e., a model to improve cross cultural interaction training of adults. We have tested the model with university students who expressed interest in inner-city teaching. While the author is especially interested in the attitudes and behaviors of servicemen overseas, it was felt that cross cultural interaction is a nearly universal problem and that this research would have applicability in both domestic and overseas situations. Our results have demonstrated that this kind of training could help this group of students. The transferability to overseas settings remains to be tested.

To use an analogy, we might successfully teach fish to jump in fresh water. Some will say, "What about in salt water?" We are not sure if the fresh water fish can survive in the sea. Our main concern is teaching fish to jump. The situation here is quite similar. We are not sure if this model will help change agents in the Peace Corps or in the military. Our concern is to increase self awareness, self esteem, etc., with the people right at hand, in this ten week experience.

For now, let us proceed to look at some of the histor-
ical events which were earlier exemplars of many of our
cross cultural problems and which created difficult environ-
ments for change agents of those earlier times.

CHAPTER II

EARLY CASES OF THE PROBLEM

It should not surprise Americans to be called "cao-mui" (big nose) in Vietnam. The term refers to more than the size of our noses. It speaks also of the lordly way in which we look down along our noses at "underdeveloped" people.

Nor should it really stun Americans that the Vietnamese word for America, "My" (which means "beautiful people") is also used in My Lai (which means "beautiful interior"). It is the same My Lai in Quang Ngai Province where some 'beautiful people' allegedly slaughtered some "gooks".

We should not be shocked because we have, after all, a sad record of expressing contempt toward people of other races, toward anyone who is heterophilous ("different") from us. Our history is a lengthy contradiction to the cry of our forefathers, "We hold these truths to be self-evident-- that all men are created equal. . . ." Our interpersonal relationships with other races and foreigners too largely deserves the caption, "Three Centuries of Contempt".

The Problem as Noted in History

The "Problem" with the American Indians

Refugees from oppression by kings and cardinals took little time in establishing patterns of contempt toward their native North American hosts. The famous speech of King Philip, Chief of the New England Indians (a confederation organized to resist the Pilgrims) is reported by William Apes to have included:

> Brothers,--You see this vast country before us, which the Great Spirit gave to our fathers; you see the buffalo and deer that now are our support. Brothers, you see the little ones, our wives and children who are looking to us for food and raiment; and now you see the foe before you, that they have grown insolent and bold; that all our ancient customs are disregarded; and treaties made by our fathers and us are broken and all of us are insulted; our council fires disregarded; and all the ancient customs of our fathers; our brothers (are) murdered before our eyes, and their spirits cry to us for revenge. Brothers, these people from the unknown world will cut down our groves, spoil our hunting and planting grounds, and drive us and our children from the graves of our fathers, and our councilfires, and enslave our women and children.[1]

The speech was prophetic. The Pilgrims sold King Philip's ten year old son into slavery and quartered and gibbeted Philip himself when they finally surrounded and captured him.

Captain Standish, romanticized in our children's history books, is alleged to have murdered groups of Indians whom he would first invite to a feast. The practice became known as

---

[1]Charles Hamilton, Cry of the Thunderbird (New York: The Macmillan Company, 1951), p. 129f.

"feasting the savages".[1]   One wonders just who the savages

were!   Captain Standish, at one point, ordered Chief

Wittumet's head displayed upon a pole in the settler's fort.

In many areas, Indians were punished for living like

Indians.[2]   In 1752 the Indians were perhaps the first human

targets of germ warfare.   General Jeffrey Amherst wrote to

his junior officers,

> You will be well advised to infect the Indians with
> sheets upon which small pox patients have been lying
> or by any other means which may serve to exterminate
> this accursed race. . . .[3]

Not all of our cross cultural interaction history is

that grim.   The Franciscan friars had a fine reputation

among the Indians.   Don Sebastian once interviewed Indians

to find out why the friars were so popular.   The Indians

replied,

> Because these (friars) go about poorly dressed and
> barefooted like us; they eat what we eat, they
> settle down among us, and their interaction with us
> is gentle.[4]

It seems sad that such an effective model for cross cultural

interaction was forgotten in the genocidal expansion of

American immigrants as they pushed westward.

The "Problem" in the American Revolution

The British presence, both civilian and military, in the American Colonies contained many irritants--some of them offensive enough to ignite the revolution. The Colonial armies had their own unique problems of effective cross cultural communication and the limiting of a two-way contempt between the military and civilians.

Our first army officers apparently modeled themselves after the British style. Officers considered themselves "gentlemen" and above such mundane things as drilling their men. Drilling was left to the sergeants. General von Steuben, a "mercenary", changed much of that by shouldering a musket himself to show the men how it was done. He also chided our new officers to lead their units in combat--not follow them.[1] Strange that a more heterophilous leader had to teach our native leaders how to reduce heterophily.

If we think of American officers as "change agents" in their efforts to train raw recruits, without the sustaining institutions of an established army, we may see that they were creating a more heterophilous condition with less and less empathy for their own men. This same condition of heterophily arose between Washington and his men and the much larger and as yet uncommitted civilian population. The civilians were being asked to change allegiances. It is

---

[1] Lynn Montross, Rag, Tag and Bobtail, the Story of the Continental Army (New York: Harper & Brothers, 1952), p. 270.

estimated that local merchants netted an average profit of 50% on sales of inferior goods to Washington's men while selling at an equal profit to the British. Many civilians refused to shelter or assist American troops. Some local governments called their militias home.[1] Not unlike modern insurgencies, the American revolution was a war for the allegiances of people. Washington, "change agent of the decade," had to keep a cool head.

After routing Washington from New York in November, 1776, the British command offered to all Americans the chance to take a new oath of allegiance to the King and receive a full pardon for treason. General Washington made a counteroffer to any who had accepted General Howe's offer, guaranteeing them protection if they would take a pledge of allegiance to the United States.[2] There were, then, great needs to gain allegiance and great resentments among the military on either side when civilians did not conform to their partisan expectations. Contemptuous treatment of civilians increased.

The British did not help their cause in New Jersey when their troops and the Hessians pillaged and robbed.[3]

[3]John R. Alden, The American Revolution (New York: Harper and Brothers, 1954), p. 213.

The raids carried out by General Henry Clinton added official theft and desolation to the problems of an already burdened population. The raids significantly increased the resistance of the Americans.[1]

Another dimension of contempt was found in the actual fighting. Washington's men had strong feelings of inferiority before the trained British troops. Better equipped and uniformed, the British also had a weapon unused by the patriots--the bayonet. Hunting muskets were simply not tooled for bayonets. The British were able to "freeze" the Americans more than once by their arrogant slashing of civilians.[2] This contempt had an important backlash. Many authorities feel that it served as motivation for improved marksmanship among Americans. By increasing their accuracy in firing from cover, they could avoid the bayonet.[3] British contempt led to the insurgents' improvement and compounded their problems of control.

The dynamic of contempt can perhaps best be seen in the example of Major General Benedict Arnold when he took command at Philadelphia. Nearly everyone resented "his rash tongue, his arrogance, his avarice and intense

---

[1]Ibid., p. 214.

[2]Allen Bowman, The Morale of the American Revolutionary Army, American Council on Public Affairs, Washington, D. C., 1943, p. 38.

[3]Ibid., p. 40.

resentment. . . ."[1] Arnold moved into the British general's vacated quarters and lived lavishly while his troops suffered. In a sense, he deliberately sought heterophily.

We are beginning to see that contemptuous heterophily is the generator of violent response on many situations of cross cultural interaction. Indeed many riots and wars can be viewed as reactions to actively induced or compounded heterophily.

The "Problem" in the War of 1812

British-American cross cultural interaction fluctuated through the next four decades, following independence. In the events which followed British General Sir John Sherbrooke's landing of four thousand British troops to annex part of Maine, we would do well to note an incident.

The British General Gosselin took great care with the local inhabitants. British officers were quartered in private homes but were monitored to see that they paid fairly for all services. Some say that the Maine people treated their conquest by the British with "surprising indifference".[2] Apparently two thirds of the inhabitants came to profess allegiance to the British Empire without a shot being fired.

We may contrast General Gosselin, a "conqueror", with General Andrew Jackson, a "defender". Jackson put himself

---

[1]Francis F. Beirne, The War of 1812 (New York: E. P. Dutton & Company, 1949), p. 291.

[2]Loc. cit.

into a frightful predicament in New Orleans when he estab-
lished martial law, imposed curfews, jailed a newspaper
editor and even ran a United States District Judge out of
the city.[1] He paid a thousand dollar fine for his treatment
of the judge. He also paid in a rebellious and uncoopera-
tive populace. Few questioned Jackson's patriotism or
ability to communicate with soldiers. It was his inability
to understand the people of New Orleans which almost cost
him his career. Here was a case of American-American cross
cultural entropy.

Meanwhile, in Ohio, an interesting development was
taking place. It was perhaps a retort to the British officer
system. Governor Meigs organized his Ohio militia by drawing
his men together and asking them to elect their own officers.
The Ohio regiments did not win the war (did anyone?), but
these regiments were noticeably better led in the field.[2]
Not only did the regiments elect the body of officers, the
junior officers then elected their field-grade officers.
This led to an interesting two-way accountability and prob-
ably a reduction of heterophily.

and Its Legal Basis in the United States (Durham, North
Carolina: Duke University Press, 1939), pp. 7-10.

[2]Alec R. Gilpin, The War of 1812 in the Old Northwest
(East Lansing, Michigan: Michigan State University Press,
1958), p. 33.

The "Problem" in the Civil War

Contempt on the part of the military toward civilians backfired for both the Union and the Confederate Armies. When General Grant assigned General Sheridan to the Army of the Shennandoah he wrote to him, "Do not burn houses, but make the valley so that a crow flying over the country would need to carry his rations."[1] As Sheridan moved through the Blue Ridge, he burned over 2,000 barns and 70 mills and took every horse, mule, cow or sheep. George Milton reports, "These tactics roused the hatred of the inhabitants to fever heat; guerrillas sharpshot his sentries; Mosby's men stung them like hornets. . . ."[2] Likewise Confederate troops lost a good many civilian friends by looting and carousing. Hotels in Savannah, Georgia and Grand Junction, Tennessee were finally razed by carousing troops.[3] By the spring of 1862, President Davis was sending directives to his men to cease burning fence posts and using steel rails from the railroad from which to hang their cookpots. The cavalry seemed to be especially fond of killing livestock for those cookpots.[4] It cost them civilian support.

[2]Loc. cit.

[3]Bell Irvin Wiley, The Life of Johnny Reb (New York: Bobbs-Merrill, 1943), p. 45.

[4]Loc. cit.

The Union Army is still best remembered in the South for its ravages upon the population. One of Sherman's soldiers wrote from Georgia, "In Covington and Oxford . . . the conduct of our division has been disgraceful--homes plundered, women insulted, and every species of outrage committed."[1] The South Carolinians also appeared to bear extra suffering--explained by some as the result of Harper's Ferry.

Even the Indians in the South--though not interested in politics--were molested by the Northerners. One woman wrote, "The Northern men were so mean to the Choctaw women, they would jerk their earrings from their ears and lock the women in one stuffy room together."[2] Vulgarity and plunder by the Union Army is still recounted by Southern civilians. We may well ask ourselves if the Union Army had been better controlled and more considerate of human and property rights if (a) the war might not have been shorter and (b) there might be less bitterness toward the North today.

The "problem" of contempt within ranks seemed to be even greater in the Civil War than in the War of 1812. Both sides used brokers to enlist recruits. Some men became officers not by election or by education but on the basis of

---

[1] Bell Irvin Wiley, <u>The Life of Billy Yank</u> (New York: Bobbs-Merrill, 1951), p. 255.

[2] <u>Loc</u>. <u>cit</u>.

the number of volunteers they "enlisted".[1] In this situa-
tion, the contempt between officers and enlisted men seemed
to be mutual.

For our interests the most significant development of
this period was the creation of a Military Code of Conduct.
Dr. Franz Lieber was the principal architect. Born in and
driven out of Europe, Dr. Lieber had two sons in the Con-
federate Army (one was killed) and two sons in the Union
Army (one lost an arm). Dr. Lieber wrote and President
Lincoln approved, "Men who take up arms against one another
in public do not cease on this account to be moral beings,
responsible to one another and to God."[2]

The finished document was known as General Order 100.
It established a basis on which commanders were expected to
act in their relations to the people. The order covered a
gamut of relations between the invading army and the civil-
ians of the occupied area. For example, it gave the com-
mander some guidelines for distinguishing between disloyal
citizens who were in sympathy with the rebellion without
positively aiding it, those who took up arms, those who aided
with supplies and those who were forced into aiding the
rebellious force.[3]

Government," American Historical Review, 49 (July 1944) p. 638.

[3]William E. Daugherty and Marshall Andrews, A Review of
U. S. Historical Experience with Civil Affairs, 1776-1954

General Butler, of the Union Army, was finally brought to a halt by this order. He so thoroughly antagonized the people of New Orleans that he was denounced by the British parliament, and finally by the government in Washington.[1] He imprisoned clergymen for praying for their own soldiers and gave an order that classified as a prostitute any woman who made any kind of dissenting gesture or unfriendly remark to a Union soldier. Butler was relieved in late 1862, but only after he had guaranteed greater Southern resistance.

The "Problem" in the War with Spain, 1898 and Its Aftermath

While primarily a naval confrontation, the War with Spain did take large bodies of troops onto foreign soil for the first time. It was also the first time American troops had to care for large numbers of foreign speaking refugees.[2] The problems faced with Cuban and Puerto Rican refugees involved cultural as well as language differences. We did not understand, for example, how to identify their local leaders.

An interesting contrast was provided between the leadership styles of General Leonard Wood (a surgeon from Harvard)

(Bethesda, Maryland: Operations Research Office, Johns Hopkins University, 1961), p. 96.

[1]Carl Sandburg, Abraham Lincoln: The War Years, Vol. 3 (New York: Harcourt Brace and Company, 1939), p. 66.

[2]Report of Secretary of War for FY 30 June 1898 (Washington, D. C.: U. S. Government Printing Office, 1898), p. 59.

and General John Brooke (22 years older than Wood). Brooke
was apparently one who lived by the "book", refusing to
issue food until Washington approved, using Spanish and
Cuban officials left from the old regime (who were felt by
the people to be repressive), and creating four departments
to deal with the people.[1] Wood became much more interested
in public health problems and schools; and he frequently
disregarded regulations in order to get food to the people
when it was needed. He appointed a citizen's council of
fifty members to nominate candidates for higher positions.[2]
His reduction of heterophily saved many lives. It meant that
at times he had to "join the revolution" against his own
sponsor. But in the end, everyone's interests were better
served.

President McKinley issued a strange order after the fall
of Manila. He refused to let the Philippine people jointly
administer the government with the Americans. This dealt a
heavy blow to Filipino morale and prestige.[3] Whether this
decision was made because of general policy in Washington or
because of a judgment that the Filipinos were not capable of
governing themselves--the action was insulting and the
result was a compounding of heterophily.

---

[1]Ibid., p. 393.

[2]Ibid., p. 391.

[3]Carl Grunder and William Livezey, The Philippines and
the United States (Norman, Oklahoma: University of Oklahoma
Press, 1951), p. 23.

Major General Elwell Otis was given the task of break-
ing the news to the Filipinos that President McKinley had
in mind for them a future of benevolent American assimila-
tion and/or paternalism. Otis toned down the message but
fighting broke out anyway. Almost as many lives were lost
in American fighting against the Filipinos as had been lost
in fighting the Spanish.[1] Patronizing, condescending
directives bring rather predictable reactions.

Another phase of the aftermath began with the landing
of United States forces in Haiti in 1915. Again, there was
resentment because the Americans did not seem to trust
Haitians to run their own affairs.[2] The same pattern took
place in the Dominican Republic the following year. The
local people were given only very junior positions. The
military leaders who took charge of the government agencies
rarely had training pertaining to those agencies. Heterophily
was maximized. Cooperation was minimized.

The "Problem" During World War I

Little is ever mentioned about caring for civilians in
France during the "Great War". Most of us have heard only
of the trench warfare, the gas and the horrible artillery.
However, billeting of troops and the care of refugees caused

---

[1]Ibid., p. 55.

[2]Dana Munro, The Latin American Republics (New York:
D. Appleton-Century Company,   ), p. 579.

considerable tension between the Americans and the French.[1]

Procurement of labor and draft animals was also a sore point of French-American interaction. Pershing needed fifty thousand laborers. Inflation--a visitor to every war torn country--made it even more difficult to attract laborers through fixed government wages. American officers had to somehow procure those laborers. Once again we found ourselves without trained officers to deal with host nationals. Pershing wanted Clemenceau to declare a state of siege (martial law) in the rear, post areas.[2] He was concerned only with venereal disease and the combat readiness of his troops. Clemenceau was more concerned with the spirit of his own people.

During the great German drive for Paris through Chateau Thierry, French refugees poured into the American sectors. The Red Cross was of some assistance. Yet it was difficult to keep a balance between the requirements of military operations and humane considerations. One compromise, not greatly appreciated by the refugees, was to permit only blood-relative refugees to stay in given towns.[3]

Cross cultural interaction became truly tangled when Pershing's Third Army crossed the Duchy of Luxembourg.

[2]_Ibid._, p. 227.

[3]_Ibid._, Vol. 2, p. 359.

The Luxembourgers were most appreciative toward the Americans. But Marshal Foch put a French general in charge of the Americans who in turn were trying to administer some public functions in this neutral state![1] Political wrangling between the French and the Luxembourgers led to civil disturbances. None of our officers were at all prepared to administer an essentially German structure of local government. Here "noise" (in the communication theory use of the word) was largely responsible for poor relationships.

The "Problem" During World War II

In 1942 the United States Army began a school to train American officers in civil affairs and military government. However, the graduates from that school in Charlottesville, Virginia, were not present to help with the Invasion of North Africa. Nor did they arrive in time to assist in Sicily.

When Licata was captured on D-Day, one untrained civil affairs officer was available to administer the town. He found that every Sicilian municipal official had disappeared. This officer was ill prepared to meet the crises which followed. A bomb had destroyed the main sewer. It took the officer thirty-six hours to find the right people to mend it. The people were hungry. They needed flour. There was no electrical power to run the mill. There was a water driven

---

[1]Final Report, Assistant Chief of Staff, G3, American Expeditionary Force, Vol. 14 (2 July 1919), p. 56.

mill in the next town, but the people had no transport. Finally, a hearse was located to haul the wheat to the mill.[1] Such was (and is) the life of a typical civil affairs officer.

Like an old record, we repeated, in Italy, the mistake of hiring many of the wrong people. With the people clamoring to be rid of Fascists, we inadvertently hired many Fascists. We also hired local Mafia bosses and those who seemed to best speak English.[2] This latter practice continues to get us in hot water. Those who approach us and advertise themselves as interpreters seldom turn out to be especially popular with their own people.

The difference of opinion about how Americans should control their sector of Europe at the close of the war was a case of compounded confusion. At such a point, goal dissonance of the sponsoring agency makes cross cultural interaction very tenuous. General Lucius Clay, for example, pointed out that our mission in Germany was to restore a civilian government along democratic guidelines as quickly as possible. General W. Bedell Smith felt that the United States zone should be administered only by military field commanders.[3]

[2]Ibid., p. 63.

[3]Lucius D. Clay, Decision in Germany (New York: Doubleday & Company, 1950), p. 51.

In the Pacific Theater, there was even more confusion about how we should relate ourselves to host nationals. In the early island invasions, there was no question about who the enemy was or how he should be treated. However, prior to the invasion of Palau, the question was raised about rules of conduct toward neutral Japanese civilians. A query was sent back to Pearl Harbor, back to Washington and back to the staff of the invasion force with no real answer. A Marine second lieutenant within that force ended up writing the rules of engagement.[1] We assume that many Palauans survived the attack because of his humane pen.

The Okinawan campaign proved how we were victims of our incredible treatment of the Nisei. We were caught short of interpreters there. The United States Army did not admit any Nisei into its ranks until late 1942. The United States Navy never did enlist any Nisei during the war. We had two Caucasian Navy officers who were fluent in Japanese, five Army linguists, and a need in the Tenth Army alone for 100 good interpreters![2]

After Okinawa fell, we were faced with civilians who wanted to return to their farm land and a Prefecture system

of government which hardly any American understood.[1]
Okinawa is today (until the treaty is ratified) administered
by a military governor appointed by the United States.
Twenty five years of experience have not greatly increased
our expertise in relating to the Ryukuan people. (Witness
the recent riots.)

Heterophily continued to plague Americans in the island
campaigns. Upon landing in Japan, many problems demanded
immediate solutions. New currency, release of political
prisoners, surrender of arms by Japanese civilians, aboli-
tion of the secret police, dismissal of the Home Minister,
control of the devastated areas, feeding millions of unem-
ployed persons and restoring a badly hurt transportation
system were problems needing attention immediately.[2] Perhaps
the Americans agreed to allow the Japanese government to
continue because these problems were so immense.

There soon began what has been called "the great purge"
in Japan. Those leaders who were feared to be dangerous
had to be removed. Unlike the purge of occupied Korea, the
Japanese purge was met with mixed reaction by the people.
Some feel, even now, that our heterophily gap was so wide

that the Japanese were never able to communicate their feelings about the purge to the American administrators.

With the benefit of hindsight we see now that there are some problems beyond the scope of military organizations. It would have been much more logical for the State Department to have been making the plans for the occupation of Japan. No one had any idea of how many people would have to be purged nor of how many personnel would be required to complete the purge. It was accomplished in the end by the Japanese government.[1]

War intensifies cross cultural misunderstandings. For example, it is never easy for those to whom sound money is a fact of life to understand cultures where money is unsound and other kinds of tender are more important. Favors, blood lines, identification cards, ration cards and party membership may be much more important in lesser developed or authoritarian-ruled countries. In the world at large, sound money is the exception rather than the rule.[2] The American misconceptions about money added to their difficulties in the Far East. We failed to see the many forms of exchange which host nationals preferred to money.

[2]Ralph McCabe, Economic Hazards of United States Foreign Military Operations, CAMG Paper No. 4, Department of the Army, 1958, p. 85.

It is interesting to note the ranking of problems that seemed to most antagonize the local populations as reported by junior officers who served in civilian affairs and military government assignments. No two countries are the same. A survey was taken after World War II in which 882 officers reported their feelings about their overseas assignments.[1]

The Army took pains to train its civil affairs officers in how to deal with these particular problems. However, irritants continued even while the training was underway.

The "Problem" During the Korean War

Working with the Republic of Korea forces brought a plethora of subtle problems to United States officers who sincerely wanted to promote pleasant interaction. Americans expressed their feelings that Koreans were dishonest and unsanitary, with little sense of social responsibility. The Koreans continued to feel scorned, and humiliated by the Americans.[2]

Such incidents as MPs stopping the United States Ambassador's car and asking why "gooks" were riding with him,

the confiscation of a pen given to the Korean winner of the Boston marathon (on the assumption that it was blackmarketed from the PX), or the refusal to permit President Rhee to enter a United States place of entertainment in Korea could hardly reduce heterophily.[1] They are rather pure examples of racist contempt.

With the tensions which still remain in Korea, much has been tried to improve the attitudes of United States forces toward the Koreans. The American Institutes of Research developed a program which was sponsored by our Eighth Army, directed by Robert L. Humphrey.[2] The program, still running, consists of troop orientation with a strong emphasis upon American ideology. Company commanders are charged with holding weekly discussions with their men. Troops are encouraged to become acquainted with Korean families and to learn the Korean language.

Other groups have tried to address the more subtle antagonisms. Research organizations such as CRESS (Center for Research in Social Systems, American University) have been working in Korea to pin-point just where the American attitudes are the worst and the best. CRESS found that attitudes toward the Koreans were strongly related to

---

[1]Ibid., p. 31.

[2]Robert L. Humphrey, A Handbook for Overseas Orientation Officers (Silver Spring, Maryland: American Institutes for Research, 1966).

dogmatism.[1] Those scoring high on dogmatism were especially critical toward the Koreans and especially dissatisfied with their assignments.

The "Problem" in South Vietnam

Surveys have been conducted by the author and others in South Vietnam since July 1966 to reveal the attitudes of the Vietnamese toward Americans and the feelings of Americans toward their hosts.

Paternalism, condescension and contempt seem fitting labels to most of our efforts--particularly in commands where little effort is made to train men in cross cultural approaches. We shall cite more of this research in Chapter Three. For now, it seems worthy of note to mention three observations.

(1) The longer we stay in a country, the more favor-
    able our military men's attitudes appear to become
    toward the host nationals.

(2) The longer we stay in a country, the less favor-
    able are the attitudes of host nationals toward
    us.

(3) The attitude of military people overseas toward
    hosts seems to follow a trend of general United
    States public opinion at home toward those same
    host nationals.

---

[1]Alexander R. Askenasy, Perception of Korean Opinions: A Study of United States Army Officers' Expertise, CRESS, 1969, p. VIII.

Surveys conducted by the author in Okinawa and Japan seemed to bear out the same observations.[1]

From 1966 to 1968 the American attitudes toward the Vietnamese went as follows:[2]

TABLE 2-2. Personal Attitudes of American Military Personnel Toward the Local Vietnamese People, By Years

	1966	1967	1968
Like	44	55.5	66
Dislike	37	20.7	18
Mixed	19	23.8	16

From 1966 to 1968 the Vietnamese attitudes toward the Americans went as follows:

TABLE 2-3. General Vietnamese Attitudes Toward Americans, By Years

	1966	1967	1968
Like	84	76	54
Dislike	08	12	31
Mixed	08	12	15

[1] R. A. McGonigal, Report on Attitudes of Japanese and Okinawan Employees on United States Marine Corps Bases, Fleet Marine Force, Pacific, 1967.

[2] Taken from 1966, 1967, 1968 Surveys in Third Marine Amphibious Force, 1 Corps, South Vietnam and Advanced Research Projects Administration/OSD Reports 1966-68.

The behaviors associated with these attitudes have serious operational effects. Early American contempt led to later Vietnamese recalcitrance. Training slowed in pace. Only in late 1967 did some Vietnamese civilians and leaders realize that the attitudes of some Americans were improving. Time will tell as to which attitudes were communicated more permanently.

The third phenomenon which concerns the time lag between United States public opinion and military attitudes toward the Vietnamese people is illustrated in the following figures (Figures 2-1 through 2-3). Note that on Figure 2-2 the amount of shaded area represents the disparity between military and civilian public opinion, i.e., the military toward their hosts and the United States public toward the war.[1]

There is reason to think that the cognitive dissonance produced by serving in a foreign country when the people in one's homeland are vocally opposed to one's involvement would indeed lead to the eventual change of attitudes toward those closest at hand--in this case the Vietnamese people.

When we look at Figure 2-3, we note that after March, 1968 the trend is toward a reduced dissonance. We might do well to note that this was at the time of the My Lai massacre. It was also the time of the TET offensive when the North

---

[1]Computations for these three charts were taken from data collected by the author, 1966-1969 and from Hazel Erskine, The Public Opinion Quarterly, March-April 1970, pp. 134-150.
FIGURE 2-1. Disparity between United States Public (all ages) and United
States Marine Corps with respect to positiveness of attitude
toward local Vietnamese.
FIGURE 2-2. Disparity between United States Public (all ages) and United States Marine Corps with respect to negativeness of attitude toward local Vietnamese.
FIGURE 2-3. Disparity between United States Public (ages 21-29) and United States Marine Corps with respect to positiveness of attitude toward local Vietnamese.

Vietnamese waged some of their most massive attacks. It was also a period in which our forces sustained their highest rate of casualties.

When we look at the age group within the United States which makes up the most immediate peer-group to our servicemen, we see what appears to be a "pull" toward conformity of opinion. In such an attitudinal environment, we would expect that a massive effort would be necessary to counteract the dissonance produced in an unpopular war. We have, in other words, two forms of heterophily--American vs. Vietnamese and American military vs. American civilian population. This suggests that an even larger factor--the total surrounding climate of opinion--should be taken into account if we are ever to achieve really effective cross cultural communication in places like South Vietnam.

The "Problem" in the Peace Corps

Close liaison has been maintained by the author with Peace Corps trainers over the past six years. We share many of the same selection and training problems.

On March 1, 1961, President Kennedy by Executive Order, established in the Department of State a temporary Peace Corps. Its objectives are to accelerate economic and social development in the less developed areas of the world.[1] By transmitting technical skills, providing organizational

---

[1]Maurice L. Albertson, Final Report, The Peace Corps (Washington, D.C.: International Cooperation Administration, 1961), p. 3-2.

ability and fostering mutual understanding, volunteers hope
to promote peace. Little has been written about how much
the Peace Corps has done for the United States when its
volunteers return, better prepared for future service over-
seas, matured and better able to communicate with subcultures
within the United States.

Investigators at Colorado State University tried to
factor out some early problems of selection and training.
Data were drawn from 222 participants, 27 related agencies,
25 United Nations technicians and 16 ICA technicians.

They found that volunteers less than 20 years of age and
over 40 years of age were less effective and that men seemed
to make slightly better adjustments to the new culture than
women.[1] They also measured some personality factors as
observed by the respondents as they worked with volunteers
overseas. Of those volunteers who proved to be ineffective
77.9% were rated as condescending toward people, 96.7% were
rated indifferent and 98.9% were rated intolerant.[2] Those
rated as very effective were also rated very good in their
ability to get along with others (96.7%) and 97.2% were
rated as being very adaptable to new situations. There was
also a very strong correlation of field performance with
self-reliance and emotional stability.

Eight years later those who designed Peace Corps train-
ing had arranged some of their training objectives into a

---

[1] Ibid., p. 7-3.

[2] Ibid., p. 7-4.

hierarchy of importance for future field effectiveness:[1]

Briefly, these are:

1. Increased self awareness
2. Increased self confidence
3. Reduced need for recognition
4. Increased ability to tolerate ambiguity
5. Increased ability to cope in trying conditions
6. Increased self regulation

The following social/interpersonal objectives are also considered essential:

1. Awareness of one's effect upon others
2. Sense of responsibility to host nationals
3. Ability to work as a team member
4. Increased empathy
5. Increased communication skills
6. Increased interest in others
7. Increased ability to relate without conditions
8. Increased tolerance and appreciation for others

As with every agency sponsoring representatives over-seas, the problem is one of heterophily--the differentness of our representative from his host culture. The problem to us becomes that of selecting and training representatives so that heterophily will be reduced. The Peace Corps has had a remarkable record of successes. Unfortunately, its mistakes capture headlines in both the domestic and foreign press.

The "Problem" with Metropolitan Police

Increasingly our large cities are becoming traps for minority groups. Police who patrol the neighborhoods of these cities did not create the problems of crowded housing,

---

[1]Albert R. Wight and Glendon Casto, Training and Assessment Manual for a Peace Corps Instrumented Experimental Laboratory (Estes Park, Colorado: Center for Research and Education, 1969), p. 31.

poor schools, unemployment, broken families and racism. Somehow they must cope with people who are often hostile toward authority, confused and generally bitter toward the world.

Increased skills in cross cultural interaction will not solve all of the basic problems of our cities but they can lessen the number and tone of the incidents between police and citizens.

Simply stated, "the problem of police-community relations is one of developing mutual respect and confidence."[1] But a crowd of 500, spoiling for trouble, spilling down Springfield Avenue in Newark, New Jersey is hardly a simple problem to solve.

A survey in Washington, D. C. revealed that the police themselves feel that only a few of their ranks are responsible for the bad police-community relationships. They feel that too much of their time is spent going after "little things" while the really "bad ones" are ignored.[2] They admit that too many from their own ranks seem to enjoy "pushing people around".[3]

Over half of the citizenry contacted in the survey believed that being Black made a difference in how police

---

[1] Report of the President's Commission on Crime in the District of Columbia, Metropolitan Police Department (Washington: U. S. Government Printing Office, 1966), p. 62.

[2] Ibid., p. 64.

[3] Ibid., p. 65.

treated them. One fourth believed that the police physically mistreat Blacks. Ten percent reported incidents of being mistreated.[1]

There was an interesting correlation along the lines of socioeconomic class. People from the lowest economic level felt that they were picked on for "little things". They were also the ones who thought that the pay for policemen should be increased. People from the lower income levels did not identify with civil rights in terms of race or ideology so much as they did in terms of rights of the accused.

People from the upper income brackets tended to be much more pleased with the way police act in their neighborhood. Sympathy was expressed for the police who have a "tough" job and who sometimes need to "get a little rough" to accomplish it.[2]

Viewed from a distance we might say that this is another example of heterophily. The police apparently feel more "at one" with the wealthy than they do with the destitute. Our problem is, therefore, one of increasing empathy on the part of the police with the clientele in the poorer neighborhoods.

It is indeed disheartening that we seem to learn so little from our own recent history. In the 1968 riot in Washington, D. C. the police admitted that many mistakes were

---

[1] Ibid.

[2] Ibid., p. 66.

made. But few realize the positive factors which emerged.
Once apprehended, looters were amazingly cooperative.
They were handled with amazing ease by police of their own
race.[1] Administrators saw the wisdom of reducing heterophily.

During the 1967 Detroit riots, over 100,000 rounds of
ammunition were fired at what was later determined to be 14
confirmed snipers. This, if the rounds were actually fired
only at snipers, comes to 7,142 shots taken at each sniper.
Such over-reaction says a great deal about regard for the
equal importance of people of other races as well as the
marksmanship of Detroit's police.[2]

The author was asked to testify before the California
Commission on Riot and Civil Disorder Control in August 1970.
While there he noted that in the previous fiscal year, 77%
of the Commission's funds had gone for new police equipment
and 4% went to the Marin County Human Rights Commission.
In fairness to the Governor's Commission, the Marin County
request was the only one in the state asking for help with
empathy training for its police.

The "Problem" in the Inner City Schools

As long as inner city schools are staffed by teachers
living in the suburbs and are populated by students of low

----

[1]Ben W. Gilbert, Ten Blocks From the White House
(Washington, D.C.: Frederick A. Praeger, 1968), pp. 96f.

[2]Philip Meyer, "Telling It Like It Is", The Seminar,
September, 1968, p. 16.

socio-economic status, we are going to have severe communi-
cation problems in those schools.

Even when teachers return directly from college to their
home towns to teach, there is a heterophily problem. Four
years in a "foreign" culture is enough to produce both an
age and a communication gap. The teacher-student role expec-
tation creates heterophily in itself. Our teacher education
programs have been noticeably lacking in opportunities for
prospective teachers to improve their interpersonal skills.
Corrective action seems sorely needed.

Summary

In this brief glance through the history of American
involvement with people of other cultures overseas and at
home, we may make the following observations:

(1) The more heterophilous the interaction between change
agents and their clientele, the greater the need for increased
self awareness, increased tolerance for ambiguity, increased
empathy and self confidence.

(2) The more contemptuous the expression of heterophily,
the more damaging the reaction to operational productivity
and future accord.

(3) Whenever cross cultural interaction involves the
threat of violence, e.g., in riot control or military opera-
tions, pre-deployment and in-service personal interaction
training are even more crucial to successful communication.

The history of our overseas involvement reflects a dearth of predeployment training beyond language skills and the transfer of area information. Lest these mistakes be endlessly repeated it would seem that interpersonal skills should be central to future training. Chapter Three describes some of the fundamental knowledge now available to assist in the design of that training.

CHAPTER III

REVIEW OF RELEVANT RESEARCH

In this chapter we shall attempt to look first to the research which has been done in the field where change agents are at work and are in the process of cross cultural interaction. We hope to extract the variables which most interest us as being (a) crucial to personal interaction and (b) attitudes, skills or information which can be modified or transferred in a training context.

We hope next to look at the previous research and theoretical bases for the learning of similar interpersonal skills. Upon completion of this second survey, we shall attempt to fit together a model which will apply theory to demonstrated needs. This will, of necessity, be a rather eclectic model using what we think are the most relevant findings from already established "schools" of cross cultural interaction training.

Previously Reported Cross Cultural Interaction Research

The Peace Corps

One of the richest sources of research data on cross cultural interaction comes to us from those having had a part

in selecting, training and supervising Peace Corps Volunteers.

Early Peace Corps training seemed to be modeled after the classical Foreign Service institute approach. Language training and area studies dominated the curriculum. The rationale seemed logical. Robert Politzer reported, "If we teach language without teaching at the same time the culture in which it operates, we are teaching meaningless symbols. . . ."[1] His words were echoed by Robert Maston who felt that area studies were closely interrelated to the primary learning need--language. Maston wrote, "To separate the language training from area studies . . . will desiccate his [the volunteer's] motivation, and render lifeless and meaningless the medium of interpersonal communication, and language."[2]

A short time later "sensitivity training" was added as the third most important element of training.[3] Though it seemed that no two universities under contract to assist with training could completely agree on curriculum, more universities did put formal "sensitivity training" into their schedules.[4]

[3]Deborah Jones, The Making of a Volunteer (Washington, D. C.: Office of Evaluation, Peace Corps, 1968), p. 70.

[4]Ibid., p. 2.

By 1968, many in Peace Corps training positions (e.g., Albert R. Wight, Mary Anne Hammons, John Bing, and Julia Lydon) were saying that of prime importance was the ability to be aware of one's self, one's own values and how one is coming across to others.[1] A growing number of trainers felt that experiental learning was perhaps a better mode than classical studies for the acquiring of the ability to piece together one's own coping strategies.

More emphasis was placed on recognizing the individuality of each volunteer. Self Awareness became the first response to the author's question to many Peace Corps trainers, "What is the most sorely needed ability in your Volunteers?" The need to be aware of ourselves and aware of how we are coming across to our associates loomed larger from 1966 on in the author's conversation with trainers. Some said, "It is the warm response of one human being to another, a highly individual thing, that is most important for effective Peace Corps service."[2]

By 1969 several who were responsible for training had redefined their objectives. Their priorities were to create opportunities so that each individual volunteer might

[2]Ibid., p. 25.

develop:[1]

    a.   increased self-insight and understanding

    b.   increased self confidence and self reliance

    c.   reduced need for recognition

    d.   increased ability to tolerate ambiguity

    e.   increased ability to cope, to bounce back

    f.   increased self regulation and self control

    g.   increased awareness, clarity of perception

Next followed social objectives:

    a.   awareness of effect upon others

    b.   sense of responsibility to the host national people

    c.   ability to develop effective relationships with

        host national and Peace Corps superiors, peers and

        counterparts

    d.   increased concern and consideration for others

    e.   increased ability to communicate

    f.   increased interest in others

    g.   increased interest in relating to others in a way

        that is neither punishing, demanding nor belittling,

        with warmth

    h.   increased tolerance and appreciation for ideas,

        values, traditions quite different from one's own

---

[1]Albert R. Wight and Glendon Casto, <u>Training and Assess-ment Manual for a Peace Corps Instrumented Experiential Laboratory</u> (Estes Park, Colorado: Center for Research and Education, 1969), pp. 30f.

When we look at the training objectives of the same Peace Corps just eight years earlier, we see the following priority:[1]

(1) to provide technical and organizational skills and respect for the dignity of labor. . . .

(2) to break through barriers of mutual suspicion and misinformation. . . .

(3) to give excellent preparation to a carefully selected group of young Americans for overseas work.

(4) to provide an opportunity for personal expression of American ideals.

It seems that eight years of experience helped, among other things, to isolate and to make more explicit the central training needs for effective cross cultural interaction of Volunteers.

The curriculum for Peace Corps Volunteers as suggested in 1961 reflects a much more classical, academic training agenda:[2]

Politics	30 sessions	2 hours each
Culture	30 sessions	2 hours each
Area Studies	30 sessions	2 hours each
U.S. Civilization	30 sessions	2 hours each

---

[1]Maurice L. Albertson, Final Report, The Peace Corps (Fort Collins, Colorado: State University Research Foundation, May 1961), pp. 3-9.

[2]Ibid., pp. 1-5.

Teaching Methods	30 sessions	2 hours each
Language	60 sessions	4 hours each
Orientation	12 sessions	4 hours each

We could find no empirical research relating desired field behaviors to training curriculum. Considerable research has been conducted on the validity of tests for Peace Corps Volunteer selection (Arnold 1967; Thomson, 1963; and English, 1964).[1] Inferentially, by looking at curricula in 1961 and 1969, we conclude that Peace Corps administrators and trainers found that their early objectives were not satisfactory. On the basis of the field experience of thousands of Volunteers, the above objectives were modified so that self awareness had highest priority.

Other American Civilian Agencies Overseas

It is difficult to estimate just how many Americans are overseas at any one moment. The State Department's Administration for International Development employs thousands of professional change agents and technicians in other cultures. American businesses and voluntary agencies sponsor even more.[2]

---

[1] Ibid., pp. 12-18.

[2] In 1959 there was a total of 1,590,000 Americans living abroad. By 1969 there were 2,800,500 servicemen and their dependents living abroad. Harland Cleveland, Gerard J. Mangove and John C. Adams, The Overseas Americans (New York: McGraw-Hill Book Company, 1960), p. 4; and information from Comptroller Manpower and Reserve Affairs, Department of Defense, Washington, 1969.

We looked for research related to their preparation for overseas assignment.

Francis C. Byrnes found in his study of technicians overseas that few reported signs of culture shock until about the sixth month and that many frustrations were then related to their American sponsors. The chief source of discontent reported in Byrnes' study was in the world of work, i.e., the level of satisfaction of overseas Americans was highly correlated with the extent to which they fulfilled their own work expectations.[1] Byrnes noted that "For work related interaction with nationals knowledge of the local language is perceived as relatively unimportant, except in French and Spanish speaking countries."[2]

Hodgson studied the interaction of 250 American and Western European employees who worked for an oil firm with 17,500 Iranians. His study tested the hypothesis that "men of good will from diverse cultures will function highly in-efficiently in an industrial partnership as a result of their inability to recognize the basic differences in one another's culture patterns."[3] This led him to survey the status of

[2]Ibid., p. 2.

[3]Francis Xavier Hodgson, "Cross Cultural Conflict: An Illustration of the Implications for American Business Management Overseas," Michigan State University, 1961, p. 1.

orientation programs offered by 41 United States firms in
sending people to the Near East. He found, among other
things, that:

    4 firms provided mimeographed bulletins prior to
      departure

    1 firm had a formal predeparture orientation
      program

    2 firms offered some printed literature from
      tourist agencies

    34 firms had no programs and offered no literature.[1]

More recently there has been an emphasis upon change
models and systems analysis for overseas technical assis-
tants. The work of J. S. Johnson is representative of this
emphasis. He found that strategies for change comprised
the essential ingredient differentiating successful from
unsuccessful cross cultural performance.[2] His and similar
findings imply that if we more heavily emphasized community
development in our training, our overseas agents would
interact more effectively with host populations.

Recently several clergymen have reported on the chang-
ing styles of preparation of missionaries for overseas
assignment. The substitution of the title "fraternal worker"
for "missionary" seems to be indicative of a more enlightened

---

[1]Ibid., p. 120.

[2]Jay S. Johnson, "Some Methods and Functions of Evalua-
tion for Cross Cultural Clinicians," Ph.D. Thesis, Cornell
University, 1969, p. 113.

approach. Dr. Ted Ward[1] has been active in bringing on-the scene learning experiences to such "fraternal workers" already in the throes of culture shock.

Many research efforts are in progress to aid overseas educators and other change agents with specific cross cultural problems. Stump, Jordan and Friesen are at work on an eleven-nation study concerning attitudes toward education and disability for vocational development. They are particularly interested in assisting educators in understanding how people gain their identity in particular cultures and how cultural changes and vocational development interact.[2]

Leonard Goodwin[3] and Gullahorn and Gullahorn[4] studied the adaption behaviors of American professors traveling overseas under the Fulbright-Hays Program. They showed that systematic probing strategies quite similar to classical scientific methods will work successfully.

Norman Cleary studied the reverse phenomenon when students from overseas return to their homelands as change agents.[1]

Domestic Cross Cultural Research

Recent research in large urban centers has focused upon the heterophily gap between ghetto residents on the one hand and police, teachers and welfare officials on the other. The Bureau of Social Science Research found in Washington, D. C., for example, that police give more thoughtful protection to those precincts in which they feel more homophilous. Residents also respond more supportively to police whom they see as "one of their own". It boils down to a matter of developing mutual trust and respect.[2] However, the commission warned that no one should underestimate the gulf of experience and misunderstanding which separates the police from poorer black citizens. Many see the police as the symbol of an uncaring establishment which cracks down only on certain offenses. Many police see everyone in a poor neighborhood as hostile adversaries.

(He found a high correlation between the feeling of powerlessness and change type (goals or no goals). He found no significant correlation between obeisance and salience).

[2]Report of the President's Commission on Crime in the District of Columbia on the Metropolitan Police Department (Washington, D. C.: U. S. Government Printing Office, 1966), pp. 62-64.

Lepper, Fawson, Newman, Berger and Littlefield[1] have studied cross cultural factors which have increased heterophily between teachers and their inner city pupils. The conclusion seems all too apparent that we can accurately describe the entropy and noise of domestic cross cultural communication. We have the wherewithal to modify attitudes and increase trust. We thus far seem to lack the will to apply our knowledge to this increasingly serious heterophily gap.

Research in the United States Armed Forces Abroad and at Home

Troop-Community Relations Program. The first large scale effort to modify the attitudes of United States servicemen toward their hosts overseas was manifested through an Army Research Office contract to the American Institutes for Research in 1964. Beginning that year with two United States Army Divisions in Korea, the project expanded to Thailand in 1968.[2] Attitude surveys were conducted across all ranks of Army men and among those civilians having most contact with the military. Dr. Robert Humphrey, Dr. Paul Spector and Dr. Troy Parris then used this survey data in an ideological and informational effort to develop in Americans higher regard for host nationals.

62

The author is indebted to these gentlemen for their assistance from 1966 onward as he worked with a similar project with the United States Marine Corps.

Efforts were made to evaluate the effectiveness of this training. Repeated surveys were taken among United States Army and Republic of Korea Army personnel showing improvements in attitudes over time.[1]

The Personal Response Project. Started by a few chaplains upon the request of Lieutenant General Victor Krulack, USMC to the Navy Chief of Chaplains, Rear Admiral James W. Kelly, this project began on an orientation-information mode and soon switched to an emphasis upon attitude modification through such interpersonal means as role reversal, simulations and non-verbal drills.

CDR Robert Mole, CHC, USN was the first chaplain sent to South Vietnam to work on the project. His research[2] was concentrated upon the collection of religious and cultural data felt to be helpful for United States personnel trying to understand the Vietnamese people.

Mole (Warren Newman, editor), Religions in Vietnam in Faith and Fact, Fleet Marine Force, Pacific, 1967; The Montagnards (Tribes-People) of I Corps, South Vietnam, Fleet Marine Force, Pacific (Forward) 1966; Vietnamese Time Concepts and Behavior Patterns, U. S. Naval Support Activity, Saigon, 1968; The Role of Buddhism in the Contemporary Development of Thailand, U. S. Naval Support Activity, Saigon, 1968.

CDR W. Warren Newman, serving as coordinator of the project, provided counsel, support, services and key inputs to training materials for use in the field and in predeployment training.[1] The first systematic random sample of United States Marine Corps attitudes was taken by the author in September, 1966.[2] The purpose of the survey was to locate problem areas, gather critical incidents for training materials and get an overall estimate of the flow of attitudes toward the Vietnamese civilian and military populations.

When asked how they felt about the local people, only 37% of United States Marines expressed unqualified likes. Only 31% reported liking the Vietnamese soldiers.[3] This meant that roughly two thirds of every one of our patrols had bad or mixed feelings toward the people they had come to help. In a war in which squad-sized units operate with great independence, far away from their responsible seniors' supervision, we were risking a great deal of hostile communication between American military personnel and their Vietnamese allies, both military and civilian.

[3] Ibid., p. 6.

Several patterns were noticed in the 1966 survey. Our sergeants and lieutenants were most critical toward the local people. (This produced genuine alarm for sergeants and lieutenants are our small unit leaders!) There also seemed to be a slump in attitudes which continued from about the third through the tenth month of a thirteen month tour.
FIGURE 3-1. Percentage of Marines expressing positive attitudes toward Vietnamese civilians and military personnel by time in country.

The following chart shows the pattern of attitudes expressed by United States Marines toward the Vietnamese

military (M) and civilians (C) when asked how Marines in general feel (GEN) and how they personally feel (PERS) (see Figure 3-2, page 66). It is also interesting to note what problem areas were most frequently mentioned by the Marines.

Those things which United States personnel noted about the people most frequently are given in Table 3-1 on page 67.

Other than the people, the things liked and disliked about the assignment in Vietnam, are given in Table 3-2 on page 68.

Surveys were repeated among the Marines in 1967, 1968 and 1969, but this was giving us only the American side of the opinion patterns. We needed information from the Vietnamese military personnel, civilian workers and local citizenry. Polling instruments were designed, tested, redesigned and employed to gather their sentiments.

The early Vietnamese returns showed us that 78% of the local people generally liked us but that already only 42% thought that we liked them![1] We also learned that the Vietnamese military had only 44% who expressed likes toward the Americans (see Table 3-3, on page 69).

While this information was useful to us, we had a strong feeling that--if anything--the Vietnamese were being overly

TABLE 3-1.   Traits of Vietnamese Most Frequently Noted By
              United States Marine Corps Personnel

Likes

    --their friendliness
    --their ability to work hard
    --make a lot out of little
    --their family life and love of children
    --their patience and perseverance
    --their bravery
    --their religious devotion
    --sympathy with their strain of having to
     fight their own people, sometimes relatives
    --their generosity
    --their quiet pride and dignity
    --their artistic ability

Dislikes

    --their "apparent greed"
    --continual begging and double price standards
    --their "apparent untrustworthiness and lack
     of patriotism"
    --their lack of sanitation
    --their uncooperativeness
    --their letting their younger children wander
     while the adults work
    --their ignorance
    --their laziness
    --their stealing
    --their corruption or apathy toward corruption

TABLE 3-2. Factors Most Frequently Associated with Viet-
          namese Assignment

Likes

    --pay benefits
    --combat experience
    --a feeling of patriotism, pride in fighting
      communism and doing something good for the
      world
    --the opportunity to travel and really get to
      know a new nation of people
    --the rapid advancement in rank
    --the weather and the food

Dislikes

    --the climate (dust, heat and rain)
    --the risks of war
    --death of friends
    --troop harassments, the changing word,
      inspections
    --lack of liberty
    --jealousy toward the Air Force and Army who
      get liberty in our TAOR
    --separation from loved ones
    --apparent lack of consistent national politics
    --disagreement with military rules of engage-
      ment

TABLE 3-3. Traits of Americans Most Frequently Noted by
           the Vietnamese

The specific traits the Vietnamese admired in the Americans
were (in order of frequency mentioned):

    Americans unite and help our people.
    They bring security to this place.
    They are kind toward our children.
    They are hard working.
    They are generous with what they have.
    They are brave and risk their lives for us.
    They are usually merry, jocund.
    They have a high sense of duty.

Their most frequently voiced complaints included:

    Americans violate our customs.
    They scorn us, speak as the teacher to the child.
    They will not speak our language--only French or
        English.
    They belittle our religions.
    They cause inflation.
    They are loud and profane.
    The Americans insult our women.
    They have no regard for our property.
    They capture some people without reason.
    They refuse our advice about VC sympathizers.*

*"Report on Vietnamese and American Attitudes in Combined
 Action Units, III Marine Amphibious Force" 30 March 1967,
 p. 27.

polite. There is a serious demand characteristic to be guarded against even though Vietnamese civilians were administering the questionnaire. We thus moved to projective instruments, e.g., the Bogardus Social Distance Scale, Word Associations, the Echo Instrument (Barthol) and Flanagan's Critical Incident technique. We boldly designed our own Thematic Apperception Test with the paintings done by a Vietnamese artist. Fourteen Vietnamese graduate students, trained in projective techniques administered the instrument throughout the five northern provinces of South Vietnam. The returns from the six parts of this instrument gave us much more "feel" and "color" of how the local population was feeling.[1] (See Figure 3-3, page 71.)

The problem of heterophily existed for other American forces in Vietnam as well. The United States Navy picked the project up in the Fall of 1967. The Army began a lecture series in the Spring of 1968. Progress for the Marines is noted in Table 3-4 on page 72.

This positive trend continued in a straight line through 1968 but fell off sharply in 1969 (perhaps due to the severe negative reactions toward the war by citizens at home). The Marines were interested in behavioral differences. They wanted to know, for example, what impact the training project was having on the number of lives being saved. A Marine

Collected and Recorded by:
G-1, 1st Marine Division, FMF PAC (Col. William Earney, USMC)

This finding sparkplugged tremendous support for the project among hard-line Marines. Strangely, it seems to bother some that a project originated for humanitarian reasons should also save lives in combat. Upon reflection and re-examination of the data it is felt that the pattern of American-Vietnamese relationships in the area under study moved positively across what might be called a "scorn ⟵⟶ acceptance" continuum.

Using our fourteen Vietnamese graduate students as interviewers, we made two sweeps of I Corps to get Vietnamese feedback. On the first we used a modified Thematic Apperception Test developed by Dr. Phillip Worschel (University of Texas). On the second we used a six part projective instrument including the TAT which we designed and described earlier. We randomly chose 260 members of the Popular Forces (local militia) to interview in 1967. In 1968, we systematically interviewed families in every tenth home in those same hamlets. We completed 473 such interviews before the TET offensive and the North Vietnamese modified our plans in 1968.

We dutifully scored both TAT instrument responses with both the Murray and McLelland scales and on these American continua found low need for power and achievement and high need-press for affiliation. We used portions of these responses in our training literature and recorded all of the responses in eight volumes of narration and translation.

Upon reading those volumes again, the author spot checked one hundred of these responses and now notes that nearly 74% of the responses could be placed along a rejection-acceptance or scorn-respect continuum. The recurring theme of sons coming home, of Viet Cong returning to the government side, of Saigon landlords leaving the farmers alone, of American G.I.s not "scorning the people" etc., is so constant that we were probably ill-advised to even look at the Murray or McLelland scales.

It is as if they (the Vietnamese) were paraphrasing the modern lyric "let me be! . . . let me be!" This and subjective experience leads the author to second the Peace Corps findings in 1969, namely that

> Our central objectives for cross cultural interaction training should be to induce greater self awareness, greater awareness of our effect upon others, less need for recognition, more tolerance for ambiguity and increased self confidence in interactions with people. We need increased sensitivity to those occasions when we are perceived as cold, boorish or scornful. We need to hesitate more in cross cultural interaction, to not leap so quickly with our stereotypes and our instant responses.[1]

One leaves South Vietnam with the notion that the wrong ally provided advisors to the other ally!

Theoretical Bases for Learning Interpersonal Skills

The following models illustrate recent experimentation to demonstrate particular interpersonal skill learning.

---

[1]Wight, et al., op. cit., p. 30.

The Culture Assimilator

Developed by Triandis, Giedler, Mitchell, Foa and Chamers at the University of Illinois, this training approach seeks via programmed instruction to prepare learners for culturally specific stimulus responses. The assimilators which have thus far been prepared for Iran, Thailand, Greece, Honduras and the Arab countries are largely weighted toward recognizing appropriate roles.[1]

The work of Triandis, McGuire, Saral, Yang, Lohard and Vassiliou, in 1968, to factor out five role differentiation discriminators from some 1620 subjects from America, Greece, India, Peru and Taiwan is still being tested in these assimilators.[2] Triandis hopes to reduce his theory to three norms: (a) giving vs. denying affect, (b) giving vs. denying status, (c) intimacy vs. formality. Based on the role theory of Biddle and Thomas the model is essentially one of cognitive pattern recognition. If one can correctly identify patterns he is well on the way toward success.[3]

The work of Triandis, Fiedler and Vassiliou[4] is quite

---

[1]Brislin, op. cit., p. 19.

[2]Harry C. Triandis et al., "A Cross Cultural Study of Role Perceptions," Group Effectiveness Research Laboratory, University of Illinois, 1968, p. 6.

[3]Loc. cit.

[4]Harry C. Triandis, Vasso Vassiliou, "A Comparative Analysis of Subjective Culture," Technical Report No. 55, Advanced Research Projects Agency, October 1967.

naturally influenced by their fellow department members Osgood, Tannenbaum and Suci. Their focus is to find semantic axes along which to measure cultural phenomena and to continue with factor regression until we are left with manageable constructs for explaining a given culture and our entry into it. It is a method which begins inductively, formulates deductive postulates and tests them empirically.

It remains to be seen if "every day" Americans will pause to use these constructs or even if they can comfortably think deductively after being exposed to so many inductive learning experiences.

Attitudinal Modification in Pre Deployment Training

One of the better designed experiments in cross cultural behavioral modification was conducted by Sidney Gael and Todd Eachus at the Ohio State University.[1] Having influenced learner's attitudes by exposing them first to positive, negative or neutral literature, they then introduced the learners to a role playing situation. Measures from Osgood's Semantic Differential were compared with Hall's Behavioral Differential to determine a significant effect between behavior and attitude modification. The focus of Gael's study, like ours, was upon the learning within the training package.

---

[1]Sidney Gael, "Cross Cultural Behavior as a Function of Attitude," Ph.D. Thesis, The Ohio State University, 1966, pp. 16-20.

Culture Shock Simulations

Samuel Taylor and Martin Sternin have, from different origins described learning strategies to directly address culture shock. Taylor cites the work of Dr. Edward H. Spicer at Cornell who in order to prepare them for culture shock introduced change agents to a dose of shock by dropping them off a few miles from a village in an Indian reservation and leaving them to fend for themselves for five or six days.[1] This could be labeled experiential and/or discovery learning. Sternin's concern is with promoting good judgment. Like Taylor, Sternin believes that a key step to surviving culture shock is to first recognize its symptoms.[2]

Sternin believes that "a man's ability to absorb frustration and to tolerate embarassment and ambiguity appear to be important in allowing him to quickly take a more stressful involvement."[3] He feels that Americans are especially threatened by ambiguity and that in their frantic striving for clarity, they sometimes exhibit inappropriate or offensive reactions such as cultural blindness, Pollyanna Syndrome, cynicism, zealotry, going native, excessive intellectualization or acts of physical force, e.g., taking property, challenging authority, initiating a fight.

---

[1] Samuel Taylor, "The Realities of Culture Shock." Mimeo, University of Pittsburgh.

[2] Martin Sternin, "Toward Specification of an Adaptation Process in Americans Overseas," Conference on Cross Cultural Interaction Training, op. cit., pp. 233-280.

[3] Ibid., p. 250.

Sternin sees the learning as a continuous repetition of the sensitization--shock-accommodation cycle.[1] He believes that the real learning takes place in-country as one starts a cultural exploration process which begins with groping, leads to systematic inquiry and finally to hypothesis testing. His thought here is quite similar to Ward, (1970)[2] and McGonigal (1971).[3] It also resembles the mazeway strategy of Anthony F. C. Wallace.[4]

Donald C. Stone, of the University of Pittsburgh, sees the problem of culture shock still more simply. To him there are only three reactions: "flight", "fight" and "adaptation".[5] He sees the problem as primarily one of insufficient understanding and he believes that it can be remedied by tighter selection procedures, orientation for newcomers, getting the wives involved in voluntary activities, circulation of literature and liaison with our embassy.[6]

[5]Donald C. Stone, "Bridging Cultural Barriers in International Management," prepared for American Society for Training and Development, May 1968, pp. 1f.

[6]Ibid., p. 11.

Dr. Stone is frequently consulted for his opinions upon international business problems by our larger corporations.

Sternin's observations are less comforting but they appear to be germane to the real point. The point is that adaptation really means taking on a substitute life style.[1] The cultural sophisticate may be able to temporarily suspend his commitments to his home and to his host systems, and to neutrally balance between the two. Most people never completely, if only temporarily, adapt or acculturate. Training, for Sternin, consists of helping the learner to realize that he can temporarily give up his protective values and roles without permanent loss.[2]

Extinction (or Denial)

The Office of Public Safety (OPS) of the Agency for International Development has conducted a fascinating experiment in its training of police agents from other countries. To them the most useful goal is training a man to tolerate foreign people and their ways for a short time period (30 days).[3] The effect is to repress, or possibly extinguish, the learning of negative information about one's hosts. As yet no one has presented data on the effectiveness of this method.

Clinical Behavior Style

Dr. Ted Ward and others, at Michigan State University,
has developed a model to assist Americans in preparation
for overseas service. The clinical behavior style is the

> . . . particular and stylized set of behaviors and
> mental processes of a person who has been specifically
> trained to utilize his experiences as a continuing
> source of new learning through which he improves his
> skills and increases his knowledge.[1]

There are three phases each having two basic types of
activity: (1) the Reflecting Phase (describing, analyzing),
(2) the Proposing Phase (hypothesizing, prescribing) and
(3) the Doing Phase (treating, and seeking evidence on con-
sequences).

Balance Theory

A useful dimension of cross cultural interaction learn-
ing is that of balance and imbalance. Quite similar to
communication phenomena noted by Heider and Newcomb[2] this
aspect of learning has to do with the necessity of imbalance
and renewed balance for any growth to take place. Robert
Foster and Jack Danielian refer to it as unfreezing and
moving and refreezing.[3] Those who would penetrate new

[3]Robert J. Foster and Jack Danielion, "An Analysis of
Human Relations Training and Its Implications for Overseas

cultures need to travel through this cycle if new behaviors are to be adopted. They must allow themselves to be thrown off balance.

The Foster Theory

This threefold approach in which the learner is encouraged to (1) recognize the motivations of his hosts, (2) redefine his mission or innovation to conform to the host culture, and (3) develop decision making skills[1] seems to be an almost purely cognitive model. It is less logically organized than that of Dr. Ted Ward. Everything hinges upon the accuracy of the first phase. No introductory skills are included.

The Contrast-American Technique

The Human Resources Research Office has developed a role playing encounter technique for more effective cross cultural communication.[2] Simply stated, an actor confronts the trainee in a specific problem solving scenario which is videotaped. The actor deliberately chooses positions in contrast to the expected American responses. Feedback is given to the learner on how our expectations are culturally biased.

Performance," Human Resources Research Office, Technical Report 66-15, The George Washington University, 1966, p. 6.

[2]Brislin, op. cit., p. 24.

Army advisors and Westinghouse executives have been tested

with significant treatment effects.

The University-Alternative Model

Designed by Roger Harrison and Richard L. Hopkins, this

model specifically tries to help the learner:

(a) become more independent of experts
(b) deal with feelings created by value conflicts
(c) make decisions in stressful situations
(d) use his own and others' feelings as information.[1]

The authors point out that:

University Education	Overseas Education
written expression is emphasized	communication is oral and non-verbal
problems solved by the individual	problems are solved by groups
information comes from experts	individuals gather their own information
reason is paramount	emotions and feelings count

The first group to use the model was composed of 82

Peace Corps Volunteers on their way to Ecuador, Chile and

Boliva. They were forced into immediate decision making.

There would be no program unless they planned it. Classroom

teaching was minimized and experience-centered learning was

maximized.

Theoretical Bases for the Variables
of Immediate Interest

Heterophily

Everett Rogers is currently studying the use of less heterophilous change agent aides as a means of increasing innovation diffusion. He found that the relationship of heterophily to innovation diffusion is curvilinear.[1] And this applies only where the heterophily has to do with technical competence. The same does not apply for effective interpersonal communication. Everett Rogers found that successful communication patterns are mostly homophilous.[2]

To get beyond this stalemate--the fact that cross cultural communication is heterophilous and most successful communication patterns are homophilous--it may be worth asking, "of what else is this also a problem?" It seems possible to think of heterophily as a case of sensory deprivation. In this sense, heterophily can be seen as culture shock in the classic use of that term by DuBois[3] to mean that anxiety which results from losing all our familiar signs

---

and symbols of social intercourse. Considerable research has been done in sensory deprivation at McGill and Princeton Universities. Vernon found that associated with sensory deprivation are: decreased tolerance for pain and greater motor control instability, color confusion, time disorientation and irritability.[1]

Heterophily might also be viewed as a case of social isolation. Bakwin and Stone studied human loneliness and how it adversely affects health and mental perceptions.[2] Brownfield feels that sensory isolation greatly reduces concentration.[3]

Heterophily could also be viewed as sensory saturation—such a heavy overload of new stimuli that the individual is unable to process any information. Time disorientation, motor impediments and hallucinations are common characteristics of the sensory saturated drug user.

Heterophily studied as an obstacle to communication, and to diffusion of innovations or as sensory deprivation, saturation or isolation remains a precondition of most cross cultural interaction.

Empathy

Empathy is the ability to project one's self into
another's role.[1]   Van Zelst[2] and Anikeef[3] measured empathy
in behavioral terms and with projective instruments.

In social-psychological terms, we look toward empathy
as the bridge between conditions of heterophily and homophily.

EMPATHY

| State of Heterophily between persons | | State of Homophily between persons |
FIGURE 3-4.   Relationship of heterophily, homophily
and empathy.

The thoughtful observer may be experiencing a "déja
vue". For, again, the early Greeks had five words to
describe what they felt were distinct levels on a continuum
of empathy.[4]

[1]Rogers, op. cit., p. 13.

[2]Raymond H. Van Zelst, "Empathy Test Scores of Union
Leaders," Journal of Applied Psychology, Vol. 36, (1952),
pp. 253-295.

[3]C. Alexis Anikeef, "Reciprocal Empathy, Mutual Under-
standing Between Leadership and Empathy," Journal of Abnormal
Psychology, Vol. 49 (   ), pp. 156-157.

[4]Rogers, op. cit., p. 218.

The early Greeks saw distinct shades of empathy. The continuum began with knowing and caring for someone. It continued on toward emotional involvement or entanglement to a complete bursting in upon another's life.

ἔμπαιος (em-pie-yos)--"knowing"

ἐμπάξομαι (em-padz-o-mai)--"to take care of"

ἐμπᾰθής (em-path-ace)--"to be emotionally affected with someone"

ἐμπαλάσσω (em-pala-so)--to become entangled together

ἐμπαίω (em-pai-yo)--"to strike in, stamp or burst in upon

Such a definition of empathy might cause counselors and therapists to cringe. Most modern psychotherapists prefer to think of empathy as "sensitive awareness".[1] Theodore Reik saw empathy as a means of reducing social distance.[2]

Self Awareness

Dr. Friederich (Fritz) S. Perls held that to increase our awareness of others we must first attend to our spontaneous selves. Self Awareness is, "the spontaneous sensing of what arises in you, of what you are doing, feeling, planning, communicating."[3]

[3]F. S. Perls, R. F. Hefferline and P. Goodman, Gestalt Therapy (New York: The Julian Press, 1951), p. 75.

Charles B. Truax developed a set of scales (see Appendix D) which when used in a differential configuration of self vs. peer measures, can give quantification to self-awareness.

Ability to Reverse Roles

Sometimes thought of as a manifestation of empathy, the ability to reverse roles is not necessarily implanted in everyone. Piaget found substitution (I'll be a cowboy) in the symbolic period of child development.[1] The concrete operational stage does not always exhibit the ability to reverse roles. With some that ability does not come until the operational stage.[2]

We have yet to see demonstrated empirically what would seem to be a logical sequence, i.e., that we must first establish role identity, and then role differentiation, before we could genuinely achieve role reversal.

Role playing studies by Janis and Mann and Elms[3] have shown that the public act of temporarily reversing roles can be a powerful modifier of attitudes. We would hope that our trainees could internally reverse roles at will.

[2]_Ibid_.

[3]A. C. Elms "New Frontier: The Peace Corps," _The Nation_, December 3, 1960.

Thus far we lack evidence as to whether everyone has the capacity for role reversal or how well it can actually be developed and/or modified in training.

Dogmatism

Rokeach (1956) says that dogmatism is the degree of openness or closedness of belief systems. The extent to which a person's belief system is open is

> . . . the extent to which the person can receive, evaluate, and act on relevant information received from the outside on its own intrinsic merits, unencumbered by irrelevant factors in the situation arising from within the person or from the outside.[1]

Rokeach's D Scale, designed to measure this phenomenon has been correlated with scales measuring anxiety, paranoia, self rejection, authoritarianism (the F Scale), rigidity, ethnocentrism, conservatism, left opinionation and right opinionation.[2] From the research thus far it seems that there is some overlap of dogmatism with authoritarianism and that it is related to anxiety.

The Rokeach D Scale is frequently used by Peace Corps training centers as part of the portfolio of learners personality measures. There is, however, little data on how sensitive dogmatism is to change.

[2] Milton Rokeach and Benjamin Fruchter, "A Factorial Study of Dogmatism and Related Concepts," Journal of Abnormal and Social Psychology, Vol. 53, No. 3 (November 1956), pp. 356-360.

Tolerance for Ambiguity

Closely allied to dogmatism, but apparently a factor distinguishable from dogmatism is a general tolerance for ambiguous messages and situations. Budner defined intolerance of ambiguity as "the tendency to perceive ambiguous situations as sources of threat; tolerance . . . as the tendency to perceive them as desirable."[1]

This concept is of interest to us because it seems crucial to our ability to pause and to reflect before making cross cultural decisions _and_ to withstand anxieties pushing us toward pre-mature assessments.

Budner's research on intolerance seems to be consistent with Adorno's work on the authoritarian personality.[2] Robinson and Shaver feel that intolerance of ambiguity is a part but only a part of the authoritarian syndrome.[3] The theoretical base is that intolerant persons and authoritarian persons tend to perceive long continua as dichotomies, to seek unambiguous answers for complex questions and to exhibit rigid, categorical thinking.

[3]Robinson and Shaver, _op. cit._, p. 322.

Self Esteem

Hunt, Singer and Cobb were interested in establishing a central dimension in the syndrome of depression. They found that dimension to be low self esteem.[1] We are naturally interested in this research because, as we noted earlier with Sternin's work, low self esteem is often associated with culture shock. It is our feeling that self esteem may also be an indicator of general élan and the motivation to communicate.

Cade measures self esteem much more carefully. He perceives self esteem to be negatively related to the gap between the way a person perceives himself and his perceived ideal self.[2]

Thus, if a person is deeply depressed but also has a very low ideal self, he, clinically, could be said to have high self esteem. The author in this study is more interested in using 'self esteem' in its more general, if less well defined, denotation of overall good feeling.

Regard for the Value of Equality

Kluckhohn, Insko, Anderson and Cote, Allport, Fishbein, Sherif and Rokeach have had keen interests in where the

[2] Alex Cade, "The Relationship Between Counselor-Client Cultural Background Similarity and Counseling Progress," Ph.D. Thesis, 1963.

value for each other as equally important human beings fits into personal value hierarchies.[1] Rokeach feels that values are really more dynamic constructs than attitudes.[2] He is especially interested in observing what happens to the values of equality and freedom when his subjects are exposed to a message saying in effect, "You obviously care more about your own freedom than you do about your neighbor's." The release of dissonance within the subject's cognitive processes has, according to Rokeach, led to demonstratable behavioral changes as observed over periods of eighteen months.[3]

In this study we shortened Rokeach's sixteen item value inventory to twelve items. We did not make any reference to the word 'equality' during the two treatment periods and we still observed significant changes in the ranking of the value 'equality' between pre and post measures. Rokeach's behavioral measures include participation in civil rights demonstrations, signatures on civil rights petitions and support of the NAACP. We do not as yet have such measures.

Non-Verbal Communication

A growing amount of research is accumulating in the

[3]Ibid., p. 181.

area of non-verbal communication. Ekman,[1] Exline,

Gray, Schuette,[2] Rosenfeld,[3] Minitz,[4] and Goffman[5] have

amassed data on facial expression, gesture, body position and

movement. Much of Ekman's work is with a transcultural

emphasis. He and Harrison are interested in isolating non-

verbal messages which can be accurately sent and received in

all countries.

Application of Theory to Perceived
Needs for Model Building

The Matching of Desired Field Behaviors
to Interpersonal Skills

If we go back to the problems encountered by our repre-

sentatives overseas and in new subcultures at home, we might

make the following connections.

(a) Behaviors Needed in the Field

1. Introductory skills (the ability to actually meet people)

2. Communication skills (verbal and non verbal)

---

[5]Erving Goffman, Interaction Ritual (Garden City: Anchor
Books), 1967.

3. Maintenance skills (the ability to feed, house, remain healthy and satisfy one's needs in the new environment)

4. Mobility (the ability to actually move around in the new culture)

5. Production (the ability to produce what one was sent to produce)

6. Termination skills (the ability to egress from the culture with maximum residual good feeling)

(b) Interpersonal Skills Related to Field Behaviors:

Field Behavior	Interpersonal Skill/Characteristic
1. Introductory	Self awareness, tolerance for ambiguity, dogmatism, regard for equality
2. Communication	Regard for equality, language, non-verbal communication, empathy, genuineness, warmth and openness
3. Maintenance	Self esteem, tolerance for ambiguity, dogmatism
4. Mobility	Tolerance for ambiguity
5. Production	Self esteem, tolerance for ambiguity
6. Termination	Self awareness, empathy, warmth, genuineness

Matching of Interpersonal Skills

Matching of interpersonal skills with instruments for observable measures and theoretical bases we come up with the following connections (see pages 95 and 96).

Interpersonal Skill/Characteristic	Instrument Measure	Theoretical Basis
a. self awareness	Truax scales	Truax, Perls
b. regard for value equality	Rokeach inventory	Rokeach, Fishbein et al.
c. dogmatism	Rokeach D Scale	Rokeach, Allport et al.
d. tolerance for ambiguity	Budner's scale	Budner
e. self esteem	Hunt's scale	Hunt, Spring et al.
f. empathy	Truax scale	Truax, Rogers, Krathwohl
g. Genuineness	Truax scale	Truax
h. warmth	Truax scale	Truax
i. openness	Truax scale	Truax
j. non-verbal communication	Videotape/panel judged	Ekman, Goffman, Harrison et al.

Field Need	Type of Learning Experience	Resources
Communication Skills	Non-verbal drills, immersion language training, sensory awareness through dance, sub-cultural penetrations to interact with specific individuals charades.	Pfeiffer and Jones National Training Lab., Esalen Institute, Dr. Bryant Wedge, Tufts Harry Triandis.
Tolerance for Ambiguity, Dogmatism	Readings, face-to-face meetings with people from heterophilous groups, getting students to make their own observations.	Foreign Service Inst., anthropologists, leaders of other races, etc.

Self Awareness and Acceptance	Encounter groups, sensory awareness exercises, individual assignments to build self confidence and trust in others.	Kairos, Topanga Center, Gunther, Schutz, Esalen Institute, Carl Rogers, Fred Perls, Gestaltists.
Role Identification and Differentiation	Problem solving assignments, movie making, dramatics, sub-cultural penetrations.	Theater arts instructors, social psychologists, H. C. Smith.
Empathy	Socio-drama, psycho-drama, video-tape replay, counterpart feedback.	Moreno, Grambs, Neil, Satir, Pfeiffer, Machover
Regard for Equality	Discussion, writing one's own declaration of independence.	Paul Spector, Robert Humphrey, Press and Arian

Summary

 We have tried in this chapter to survey those opera-
tional programs for cross cultural interaction training now
in existence, experimental programs and recent theoretical
bases for these programs. Finally, we tried to outline the
theoretical skeleton for this model. We do not yet know
the isolated treatment effect of each of these learning
experiences. It is our hope that the combined "package"
effect will improve personal interaction skills. Our central
focus, it should be remembered, is not so much on the
sponsor's goals or the type of innovations spread, but on the
human interaction between the change agent and his clientele.

CHAPTER IV

RESEARCH DESIGN OF THE TRAINING MODEL

Keeping in mind the early cases of the heterophily problem as cited in Chapter Two and attaching heavy weight to the reflections of Peace Corps trainers and the feedback from host nationals who have interacted with Americans as reviewed in Chapters Two and Three, the principal needs for improved cross cultural interaction training may be stated as:

> Increased self awareness and self esteem
> Heightened tolerance for ambiguity and reduced
>   dogmatism
> Greater ability to sense the feelings of others
>   (empathy)

In this study, we have directed our efforts to the design implementation and evaluation of a series of training experiences by which we intended to modify the following factors, deemed important in interpersonal interaction:

1. Regard for the value of equality
2. Dogmatism
3. Tolerance for ambiguity
4. Self esteem
5. Empathy as perceived by the individual
6. Empathy as perceived by the group
7. Genuineness as perceived by the individual
8. Genuineness as perceived by the group
9. Warmth as perceived by the individual
10. Warmth as perceived by the group

11. Openness as perceived by the individual
12. Openness as perceived by the group
13. Ability to communicate non-verbal messages
14. Self-awareness--the degree of congruence between self and peer ratings of items (6-12)

We saw in our literature review that the perceived problems in cross cultural interaction overseas (at peace and at war) are very similar to the problems of interpersonal communication between members of sub-cultures in our own country. Our purpose, then, was to develop and test a generalized training model which would assist adults in their interaction overseas or at home with civilians or military, young or old, male or female.

We mentioned earlier that considerable research has been conducted on the ability of given instruments to predict cross cultural effectiveness in the field. Blessed little attention has been paid to what actually happens inside the training phase. The focus of this design is thus on what happens in the training phase to the above listed fourteen variables.

In this chapter we attempt to explain how we went about investigating modifications on those variables. We look at the hypotheses we advanced, the kinds of data we needed to test those hypotheses, the population in which the testing was done, selection procedures for leaders and groups, and the design of our evaluation phase.

Hypotheses to be Tested

Our central hypothesis to be tested, then, might be summed up as follows:

> Young adults can, through a planned sequence of human relations training experiences, be seen to have improved their ability to function according to fourteen selected criteria identified in the literature as most consequential for successful cross cultural interaction.

More specifically, we proposed the following hypotheses, that upon participation in the training model the following phenomena would be observed in the behavior of these young adults:

1. Self awareness would be increased.

2. The ability to reverse roles (empathy) would be improved.

3. Non-verbal communication skills would be improved.

4. Tolerance for ambiguity would be increased.

5. Regard for the value of equality would be measurably elevated in the individual's hierarchy of values.

6. Self esteem would be increased.

7. Dogmatism would be reduced in the individual.

8. Self awareness would be increased.

9. Warmth, genuineness and openness would be increased.

10. These observed changes would not be leader-dependent, i.e., dependent upon the leadership style of the small group facilitator.

The reader will please note that we have not concerned ourselves with cultural or area information nor with language facility. It was felt that those factors are easier to

manipulate and that more is known about them than about the above factors we had selected for study.

Methodology

Population of Interest

The 288 subjects for this study were students (94%) and non-students (6%) who voluntarily participated in an elective course in the College of Education at Michigan State University entitled, "Interpersonal Skills in Teaching".

We cannot at this moment say that the model we designed and tested here will work with other populations in other climes. We cannot even say that our subjects were representative of the student body at Michigan State University or its College of Education. Nor is there any intent to generalize from a study among university students to a population of military men where only 78% have finished high school and 16.5% have gone to a university.[1] Our intent at the University was to prepare a largely white, middle class group of perspective teachers for better adjustment in inner city schools.

We have not generalized to any population other than these volunteers who were interested, obviously, in a course on interpersonal skills. We do believe, however, that the

---

[1]R. A. McGonigal, "Report on Vietnamese and American Attitudes in Combined Action Units," III Marine Amphibious Force, 30 March 1967.

hypotheses of this study, given the findings they have pro-
duced, merit testing among other populations.

Selection of Treatment and Control Groups

Because this investigation was conducted in a series
of elective courses there could be no random assignment of
subjects to treatment and control groups. Though we acknowl-
edge that random assignment is an almost universal require-
ment for experimental research design, we could not ethically
deny half of the students an opportunity to interact with
others in an effort to develop their interpersonal skills
when they had registered expecting to do exactly that.

The following design was constructed to achieve a reason-
ably defensible control group for each treatment group.

Treatment | Groups 1-6 | | Groups 7-20 | | Groups 21-28 |

           ↕ Compare   ↕ Compare

Control | Groups 7-20 | | Groups 21-28 |
FIGURE 4-1. Configuration of treatment and control
              groups, by time.

Educational research often must resort to such a design
when random assignment of subjects is impossible. Campbell
and Stanley have created a series of designs to control for
the inability to have concurrent treatment and control groups.
Their "posttest-only control group design," "the separate
sample pretest, posttest design," and "the separate sample

pretest, posttest control group design" are most closely related to the design we have chosen.[1]

D. R. Cox discusses the problem in his cross-over designs and holds that these are legitimate where the number of treatments is limited and there is little carryover effect. A single sequence design tends to have higher precision than where there are many treatments or many compartmentalized treatments.[2]

Toward the close of each academic quarter, at the same time in which the treatment groups were being given their post-tests, those wishing to take the course in the next quarter were asked to come by for a series of pre-tests on the same variables. This helped control for the possible effect of time of testing. By measuring within the same week, we controlled for such things as weather, campus mood, etc.

The fact that groups 7-20 were common to both treatment and control conditions (at different times) made it necessary to make separate analyses of their perceived variances. This analysis is reported in Chapter Five.

The 288 subjects who made up these groups had the following characteristics:

---

[1]Donald T. Campbell and Julian C. Stanley, Experimental and Quasi-Experimental Designs for Research (Chicago: Rand McNally and Company, 1963), pp. 25, 53, and 55.

[2]D. R. Cox, Planning of Experiments (New York: John Wiley & Sons, Inc., 1958), pp. 116-128.

91% were students in the College of Education, 3% were
students from other colleges, and 6% were non
students.

74% were undergraduates or outside participants, 26%
were graduate students.

57% were female, 43% were male.

82% were under thirty years of age.

10% were of minority groups.

Selection of Facilitators and Groups

Facilitators were volunteers who were interviewed and
later trained in encounter group techniques by the author.
They were selected on the basis of prior experience and
apparent warmth and good judgment. Training consisted of
three-hour, weekly sessions in which the small group's activi-
ties were modeled and in which facilitators themselves formed
ongoing groups. During Spring and Summer quarters, three
ongoing training groups were formed for facilitators. A pre-
quarter marathon encounter just for facilitators proved to be
especially helpful in establishing cohesiveness and insuring
that the overall methodology, with its emphasis on trust build-
ing, was followed. An undergraduate student facilitator and a
graduate student facilitator were assigned to each group of
eight to twelve students.

The experimental encounter groups were formed by a
process called "milling". At the first class session, the
students were asked to non verbally mill about and select
someone with whom they would like to interact. Each of these

pairs then selected another pair. Foursomes then selected foursomes. In some cases, the foursomes selected five or six other people so that no one was left without a group.

This procedure was used throughout the three quarters. Demand effects of the author were thus minimized. In retrospect, it appears that the group formation procedure also made it difficult for students to blame anyone but themselves or their partners for any unhappy consequences of the choice of members for their groups. A higher degree of commitment seemed to result from this self selection than what might have resulted through arbitrary assignment to groups.

Heavy emphasis was placed upon an effort to develop trust and confidence. Our rationale for that portion of our training may be described with the following figures.
FIGURE 4-2. Inadequate trust pedestal.

It is as if each participant stood on a trust pedestal. If this pedestal were too slim, he would not likely invest much good feeling or trust in a relationship with anyone. To cut out a portion from this small pedestal and invest it in someone else would leave him more shaky and vulnerable. If, however, that pedestal were

large and secure, he would feel at ease about investing a portion of it in someone else.

This good feeling about oneself can be thought of as the fulfillment of basic human needs, as posited by Maslow,[1] or as vital life functions in terms which would please a physician. The point is that one can not afford to invest much trust or good feeling toward others when he has too little trust himself. We were out to build larger trust pedestals.

A Galilean carpenter once urged men to love each other as they loved themselves. Perhaps one reason so few of us achieve high levels of love for others is that we have such contempt for ourselves.

FIGURE 4-3. Adequate trust pedestal.

It should not come as a surprise that the only relationship a person with a narrow trust pedestal will sometimes risk is a leaning or dependent relationship upon someone with a stronger trust pedestal.

FIGURE 4-4. Dependence.

FIGURE 4-5. Protectionism.

We were not in business
to perpetuate leaning. Lean-
ing distorts interpersonal
communication.

Leaning can happen in
two ways. Not only can the
weak lean toward the strong--
the strong can sometimes lean
out over the weak in an un-
healthy form of protectionism.
We sometimes rationalize this
leaning of the strong over
the weak as "concern",
"helping the deprived"; or
"aiding the underdeveloped".
This kind of leaning often
eases the conscience of the
protectionist and creates
hostile resentment on the part
of the one "being leaned
over". It is too transparent
that the well meaning "helper"
does not consider the other
person as a complete human
being, able to live in dignity
and to manage his own life.

We hoped to assist ourselves and those around us toward a life where we stand on our own two feet.

To be really free to be ourselves is a legitimate aim. Teachers who let students grow into what the students really want to be . . . teachers who respect the freedom to learn and the freedom not to learn . . . teachers who do not need to lean or be leaned upon . . . are considered excellent facilitators of learning![1]

One of our explicit goals was to help each other accept ourselves and to be more comfortable with ourselves.
FIGURE 4-6. Desired stance of learner.

Procedures

The group experience began with a series of trust exercises, some designed by Herbert Otto, William Schutz

---

[1]Ibid., pp. 46f.

and Frederick Stoller and some drawn from the author's
experience.

The early structure was weighted to give participants
more self confidence and generous amounts of positive data
about their peers. Crucial to the early stage was the op-
portunity for each participant to list and share his own
achievements, things he felt rather proud to have accom-
plished. Though seldom a "comfortable" experience, each
student was asked to receive the positive feedback from his
group.

Early in the course, the first "stretching" assignment
was introduced. Each student was asked to interview a
stranger in an unfamiliar part of the community, e.g., a
warehouse night watchman, a public health nurse, a "bench
warmer" at the bus station, etc. These interviews were often
taped and always critiqued for "mileage questions" (questions
which lengthened responses) and to observe when empathy
seemed to be established.

Role taking and role reversal simultations were intro-
duced. Several of them were videotaped for instant feedback.
Simulations such as one in which a student would take the
part of a teacher, a teacher the part of an indignant parent,
and a parent the part of a school administrator, increased
the feedback as to the kinds of emotions and the force of
those emotions that we communicate when we are excited.
Trust exercises such as the "trust walk" (in which one student

leads another who keeps his eyes closed), lifting and face tracing, were continued to keep the atmosphere supportive and non-threatening.

After about three weeks, an all-night marathon session was held to draw the participants out into the "deeper waters" of interpersonal trust and communication. The groups began this session with non-verbal exercises to get in touch with their feelings so that later verbal exchanges might be more relevant in their encounters with each other. After the marathon session, students used the Truax scales (see Appendix E) to give each other feedback on their empathy, genuineness, warmth, and openness.

Less structure was provided after the fifth week. Students were encouraged to take responsibility for their own learning activities. Some chose to visit schools and observe the interaction of teachers with students, teachers with administration personnel and teachers with teachers. Many students designed affective learning packages, some of which were immediately used by the public school teachers who were anxious to try them with their pupils. These were self contained, especially designed learning experiences to facilitate the learning of such things as sharing, how it feels to be a minority person or the new child in school.

Non-verbal exercises continued. At the eighth week the students traveled to a YMCA camp to spend a weekend together. The encounter group mode continued. But, as on the

marathon, fantasy and non-verbal exercises were introduced
to assist the participants in being more aware of their own
feelings and thus not be left to solely cognitive exchanges.
After a second use of the Truax scales, the students were
able to see their apparent improvement or regression in
the areas of empathy, genuineness, warmth and openness.
Further feedback was given to them on how they scored on the
other variables of interest, e.g., regard for the value of
equality. A non-verbal meal was held at the conclusion of
each quarter to "celebrate" the conclusion of the experience.
Having improved non-verbal skills it seemed fitting to use
them in a concluding experience.

To be sure, the entire course was different from the
usual academic offering. Its stated objectives were to in-
crease awareness of one's self and how one was being per-
ceived by others in a variety of circumstances. It was
assumed that this learning would have transferability to
teaching situations with students of other races and back-
grounds. The enrollment in the course grew from 35 students
in the Fall to 147 in the Spring.

Evaluation

Normed and validated instruments were used for all but
the non-verbal communication measures.

Non-verbal communication skills. This was a locally
designed procedure which consisted of presenting each student
with one of three sets of six classroom type messages to

communicate non-verbally before a videotape camera. The
students recorded their efforts to communicate the same
messages on a second tape at the end of the course (see
Appendix G). Both sets of tapes were later analyzed by a
panel of six people who had demonstrated considerable
sensitivity in interpersonal communication. Three were ex-
teachers and three were undergraduates. It was possible for
the panel to award a point for each message correctly per-
ceived and up to four points for the strength of the per-
ceived non-verbal message. The messages were randomly
assigned. The tapes were randomly edited so that the panel
had no clue as to whether a student was performing before
or after the treatment. Change in non-verbal skill was taken
as the difference between beginning-of-course and end-of-
course scores as assigned by the panel of judges.

Ability to reverse roles. This measure was taken from
the empathy portion of the Truax scales (see Appendix E).
One could score from one to five, representing a range from
almost complete disinterest in another person to the
ability to perceive unspoken feelings as well as overt
characteristics of the other person.

Self awareness. This variable was a composite congru-
ence measure using all of the Truax scales. If self aware-
ness is the condition of knowing how one is actually feeling
and how he is being perceived by others, it follows that a
legitimate measure of this is to compare his self rating with

the group's rating. The lower the difference across all
four variables, the more accurate is his awareness. Again,
the range of possible scores was from one to five.

Regard for the value of equality. Using a modification
of Rokeach's Value Inventory (1969), we were interested only
in the ranked position in which the student placed "equality".
Mention of that word was studiously avoided by the author
throughout the treatment period. Professor Rokeach's work
involves the releasing of cognitive dissonance about where
one places equality (usually lower than his regard for his
own freedom).[1] We were anxious to see if placement of this
value, "equality", would move without specific mention of
the term, just by the result of the interaction experience.

Dogmatism. We used Rokeach's nationally normed D-scale
to assess dogmatism in both pre-tests and post-tests.

Tolerance for ambiguity. Budner's Scale for Intolerance
for Ambiguity was used to assess where our students seemed
to be both before and after with respect to this varia-
ble. To reduce "demand effect" we took the liberty of
labeling it a "complexity scale".

Self esteem. Hunt's Scale for Low Self Esteem (1967)
was used before and after the training period to assess any
change in self esteem.

Empathy, genuineness, warmth and openness. These are
all elements of the Truax scales. Self and group mean scores

---

[1]Milton R. Rokeach, Beliefs, Attitudes and Values
(San Francisco, Calif.: Jossey Bass, Inc., 1969), pp. 168-178.

for each individual were reported on each variable for each student as described above.

Leadership style and group treatment effect. In our research design, we were concerned about the effect of leadership style upon perceived changes in our variables of interest. We wanted to be sure that, as far as possible, treatment effects would be due to the training activities and not a function of the particular style of the group leader.

Daniel B. Wile, Gary D. Bron and Herbert B. Pollack have designed an instrument to define leadership styles in group therapy and/or encounter group settings. Called the "Group Therapy Questionnaire" (GTQ) (see Appendix G) this instrument consists of twenty realistic situations with each situation being the stimulus for one of nineteen responses. When those responses are coded and put in ratio form, they present a picture of directive versus non-directive, group centered versus individual centered, and confronting versus reassuring styles of leadership.[1]

We asked all facilitators to fill out this questionnaire so that we could later correlate their leadership styles changes on the dependent variables. We used three continua of leadership styles. They were the result of collapsing five more detailed continua into non-directive versus

---

[1]Donald B. Wile, Gary D. Bron and Herbert B. Pollack, "The Group Questionnaire: An Instrument for Study of Leadership in Small Groups," Psychological Reports, 1970, 27.

directive, reassurance versus confrontation, and group centered-individual centered approaches.

Problems Expected and Found

It is important to note with regard to research design that no assumption of independence between subjects could be met. Although the students were given these instruments in separate envelopes and asked to complete them individually, there was no independence of treatment. They shared the same group experience. Therefore, group mean scores are reported for all measures. This causes a severe reduction of degrees of freedom in the analysis and statistical loss of discriminating "power". This is simply part of our design problem. There was independence of treatment between groups.

It should also be noted that there is a ceiling effect on some of the variables. College of Education students start off four ranks higher on "equality" in Rokeach's Value Inventory than do Michigan State students in general.[1] On a twelve item scale, if a group averaged 1.6 on a pre-treatment measure, the highest it could attain would be a 1.0, while if it started off at a 5.6, it would have much more room for improvement. The ceiling effect was a factor in the D Scale and on the Hunt and Budner Scales as well.

It should also be noted that our population was expected to be more homogeneous than a complete cross section of MSU

---

[1]Rokeach, op. cit., p. 169.

students. These instruments would not then discriminate as well in this population as they would in a larger and more heterogenous population. Statistically, we were looking at a relatively homogeneous segment from a wider and more variant population distribution.

Because this was a pilot study, we were interested in getting many measures on each individual. From a statistical position, we overloaded ourselves. We have more measures than we have individuals within groups. We traded the likelihood of getting statistical significance across all measures for the satisfaction of our curiosity. We are not sorry that we made this trade.

Reporting of Scores

Test scores on each of these variables were recorded in two forms. Individual students' scores were averaged together in their small groups to form raw group mean scores. These scores would be used in the treatment versus control analyses. With the assistance of Dr. Andrew Porter these raw group mean scores were converted into transformed standard scores for the repeated measures analyses. These scores were computed using the following steps:

(1) performing a oneway analysis of variance across all groups for each variable,

(2) pooling the mean square within from pre and post treatment scores on the same variable,

(3) taking the square root of the pooled quantity, and

(4) dividing each raw group mean score by that product.

$$x' = \frac{x}{\sqrt{\dfrac{MSW\ Pre + MSW\ Post}{2}}}$$

We now had our scores for the repeated measures analyses arranged with a common metric. This would enable us to graphically portray all fourteen variables on the same axes. It also enabled us to compute analyses of variance across time, quarters, measures and groups.

Expected Outcomes

When we began our study, we hoped that our treatment would show at least a monotonic effect across all measures. We knew, however, that an openness increased (as measured on the Truax scales) perceived warmth might very well decrease. We simply could not predict in which direction these Truax variables might move.

We did expect strong correlations as follows:

(a) intolerance for ambiguity with dogmatism

(b) self esteem with perceived warmth

(c) high regard for equality with high tolerance for ambiguity

(d) openness with non verbal communication skill

(e) genuineness with self awareness

The variables which we thought would change most markedly under the treatment condition were:

(a) tolerance for ambiguity

(b) non verbal communication skills

(c) self esteem

(d) empathy

We expected that the variables most insensitive to treatment would be self awareness, regard for the value of equality, and openness. The study showed among other things that we lack enough data to make very good predictions about change in tolerance for ambiguity, self esteem and the Traux measures of warmth, genuineness and openness.

Place of the Training Model in Future Experimentation

It is important to note that this is a pilot study. No presumptions of exhaustiveness are made. We noted on page five that there has been little study of within-training learning in cross cultural interaction. (Gael's study noted in Chapter Three was the only research found to be concerned with attitude change measures taken within the confines of training package.)

At no place in this design have we had any legitimate theoretical bases to set criterion levels for our learning experiences. Some variables, such as self esteem and openness, may actually be curvilinear in their desired outcomes. The criterion levels for self esteem and openness have yet to be established. Therefore, we would do well to keep our model in perspective as part of a larger body of continuing research. We shall need new models to address those variables not significantly effected by this model.
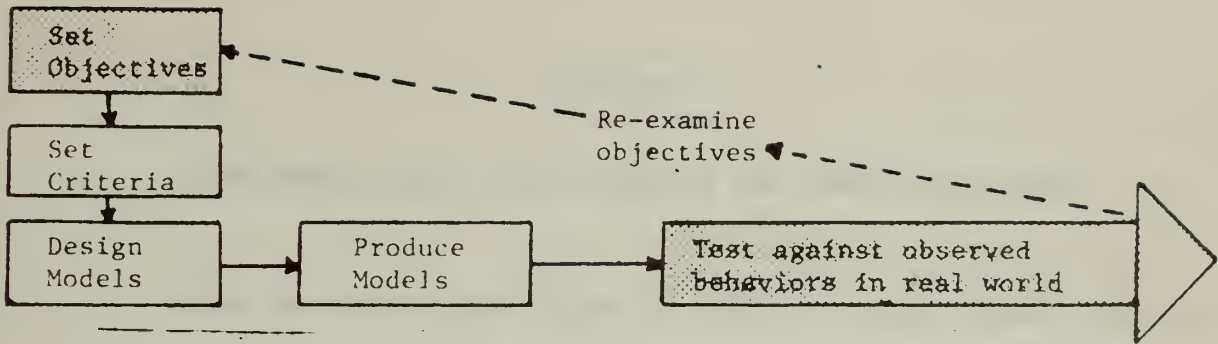

FIGURE 4-7.   System model for future training models.

Having outlined the design for this training model, let us next look at the results which test data disclosed as we tested the model over three academic quarters.

CHAPTER V

TRAINING MODEL TEST RESULTS AND THEIR ANALYSES

Upon enrolling the first students in our model training package in Winter Quarter, 1971, we began the evaluation phase with a series of pre and post tests of our fourteen variables of interest. Our training model was designed to positively effect all fourteen variables. However, we were not really sure of how those variables would interact under treatment. We were not sure that we could achieve even a monotonic treatment effect across all fourteen variables. We did not know if our treatment would measurably change our test results in the desired direction to say nothing of whether or not these changes would be statistically significant.

For example, as one's openness increased it might very well be that one's warmth as perceived by the group might decrease. Or if we increased self esteem, we were not at all sure that self awareness would also increase. Again, if we increased tolerance for ambiguity, it seemed that there might be a chance that we would decrease perceived genuineness. We were hungry for the results from the tests.

Test Results

The reader will recall that our study took place over three academic quarters. Our unit of analysis was the small group mean score on each variable. There were twenty eight experimental encounter groups, composed of a total of 288 students. The test data showed the following immediate results.

Monotonic Treatment Effect

There was an overall monotonic treatment effect in the desired direction for each of the fourteen variables. That is, the pre and post measures on all variables indicated change after treatment in the direction for which we hoped.

Gross Improvement by Variable

Since we computed transformed standard scores for all group observations, it is possible to present the change on each of those variables in a single histogram. Using our transformed standard scores, we can legitimately represent gains as if they had a common base line.[1] These gains are presented in Figure 5-1 on the following page.

A further word is in order about the assumptions which led us to consider the pre treatment scores of the Spring and Summer groups as legitimate control group scores for

---

[1]The reader will find all raw scores, transformed standard scores, and the histogram for the growth on individual variables in Appendices I, J and H.
FIGURE 5-1. Increases on scores on each of fourteen interaction factors across twenty encounter groups, expressed in transformed standard scores.

Winter and Spring post treatment scores. We are saying essentially that these samples are from the same population, and that there is not significant difference between the pre test measures of the Winter and Spring groups, i.e., that there is no evidence of maturation or history effects.

We also found that there was no significant difference between the post test measures of the Winter and Spring groups. We prove the above in our repeated measures analyses later in this chapter where we show no significant differ- ence between times (pre and post) by quarters, between times by measures by quarters, between measures by quarters and between groups within quarters.

For those who would rather look at the raw means and variances of these cells to judge the claim of equivalency we include the following two tables (Tables 5-1 and 5-2).

In this section, we have attempted to show the levels of confidence with which we report treatment effects upon the variables of interest. We have summed up in advance how our analyses of the results caused us to accept or reject the null hypotheses that there were (1) no significant dif- ferences in group variances from a standard normal distribu- tion and (2) no significant differences in mean vectors between treatment and control groups.

TABLE 5-1. Raw Score Cell Means, Treatment vs. Control Analysis

Variable	Spring Pretest 1st Control	Winter Posttest 1st Treatment	Summer Pretest 2nd Control	Spring Posttest 2nd Treatment

Analyses of Test Data

These monotonic gains represent mean differences between pre and post measures. However, they lend us no relative information until we test these gains to see if the gain on each variable, singly and collectively, is statistically significant. The fact that one variable had a very large gain may be nullified by a large measurement error.

The reader will recall that our original design problem (inability to randomly assign subjects to treatment or control groups) led us to use the Spring quarter group scores on the pre-treatment test as a standard against which to compare the post-treatment scores on the Winter treatment group. The Summer quarter group scores on the pre-test were used as the standard of comparison for the post-treatment scores of the Spring treatment group. Thus the Spring group's test scores appear twice in this analysis, first as a control (pre test) for the Winter treatment group and second, as a treatment group (post test) to be compared with the Summer pre-treatment scores. This reuse of the Spring treatment group requires us to employ separate analyses of treatment versus control groups for Winter and Spring quarters (see model on next page).

First Analysis (Treatment versus Control)

The Winter post-treatment scores and the Spring pre-treatment scores were compared with respect to mean performance scores on each of fourteen variables. The purpose of this comparison was to determine whether there were differences between the two self-selected groups of participants that could be ascribed to the treatment received by the Winter participants. All fourteen variables were used in a single, simultaneous comparison of the two groups to avoid the redundancy that would be introduced by comparing the groups separately on the basis of each of fourteen highly
FIGURE 5-3. Model for analysis of Treatment versus
Control groups.

related measures. The multivariate test of equality of the
Winter post-treatment means and the Spring pre-treatment
did not reveal a statistically significant difference be-
tween the two groups (F=2.8114, $P < 0.1299$). While this
was a surprising development it is felt to be a function of
the smallness of the treatment cell. Later analysis of pre
versus post measures on the Winter quarter showed a signifi-
cance of $P < .025$.

As we mentioned in chapter four, we looked at our test
data from two continua: treatment versus control groups and
pre versus post measures. The first phase takes the follow-
ing format.

Several different statistical criteria have been pro-
posed to determine whether two or more groups differ with
respect to an array of variables.[1] Since these criteria do
not always lead to the same conclusions, and statisticians
differ as to the relative merits of the various criteria,
four of the frequently employed criteria are cited. The
multivariate F ratio showed $P < .1299$. If Roy's criterion
is employed, the computed measure ($\theta = 0.8873$) has an associ-
ated probability, $P < .1299$, and supports retention of the
null hypothesis of no difference between the treatment and
control groups. The use of Hotelling's trace criterion
($\tau = 7.8721$, $P < 0.1299$) also supports retention of the null

---

[1]Dean K. Whitla (ed.), <u>Handbook of Measurement and
Assessment in Behavioral Sciences</u> (Reading, Mass.: Addison-
Wesley, 1968), pp. 110-11.

hypothesis. Bartlett's Chi Square Test for Significance
of Successive Canonical Variates is the single criterion
which suggests rejection of the null hypothesis (χ^2_β =
24.0120, P < 0.0457). In view of the convergence of three
of the four most commonly accepted criteria for multivariate
hypothesis tests to a single decision, that of retention of
the null hypothesis, we will assert that no difference has
been found between the pre treatment performance of the
Spring quarter participants and the post treatment perform-
ance of the Winter quarter participants.

Since the overall multivariate test did not reveal dif-
ferences between the treatment and control groups, the table
of univariate and step-down-F-values is informative to us
only in suggesting the extent of interrelationship among the
fourteen variables. For example, if the treatment and con-
trol groups had been compared solely with respect to the non-
verbal measure, we would say that there was a difference
between the groups (univariate F = 12.0602, P < .0028);
however, when this variable is considered in the context of
the other twelve variables that precede it in the analysis,
it is seen to contribute almost nothing to the detection of
a difference between the treatment and control groups
(stepdown F = .0211, P < 0.8894).

This same relationship (between univariate and stepdown
F score) works in the opposite direction as we shall see
with the variable "self awareness" in the second step of
the analysis of treatment versus control measures.

TABLE 5-3. First Analysis of Variance All Fourteen Variables

*Significant P<0.10
**Significant P<0.05
***Significant P<0.01

Second Analysis (Treatment versus Control)

In this analysis we have more information with which to work. We have fourteen treatment groups instead of six. Data in this analysis are based on the observations of 166 people rather than 122, because of the higher registration of students in the course.

And this time the F ratio for the multivariate test of equality of mean vectors is highly significant. It works out to be 4.3573 (with d.f. - 14, 7 our P value is less than 0.0289). See Table 5-4, on the following page, for all fourteen variables at one time.

Note in Table 5-4 that while the same thing that happened in the first analysis with non-verbal communication between the univariate F ratio and the stepdown F ratio, this time self awareness goes from a univariate F with $P < .0001$ to a stepdown F with $P < .0075$--highly significant.

The variance of canonical variate 1 here is 8.7146. Roy's criterion (M=6, N=2.5) is .8971. Hotelling's trace criterion = 8.7146. Bartlett's Chi Square test for significance of successive canonical variates = 29.5571 (d.f. = 14) ($P < .0088$). The canonical form of least squares estimates of variates effects = 5.851135. All of this suggests that with a more stable (higher degrees of freedom, less variance) treatment group we have more highly significant results.

The Discriminant Function Coefficients of the variable taken in standard order of presentation (with no thought to their ordering) is given in Table 5-5 on page 133.

TABLE 5-4. Second Analysis of Variance, Fourteen Variables

Variable	Univariate F	P Less Than	Stepdown F	P Less Than
1. Value Equality	6.4610	0.0195**	6.4610	0.0195

TABLE 5-5. Discriminant Function Coefficients, Fourteen
Variables, Second Analysis

Variable	Raw Coefficient	Standardized
1. Value Equality	0.296248	0.3257
2. Dogmatism	-0.022141	-0.1974
3. Ambiguity	-0.001917	-0.0085
4. Self Esteem	-0.254098	-0.9684
5. Empathy Self	-2.534410	-0.9757
6. Empathy Group	2.611634	0.7506
7. Genuineness Self	0.385265	0.1261
8. Genuineness Group	-1.685188	-0.4732
9. Warmth Self	3.784016	1.7007*
10. Warmth Group	-7.559594	-2.1716*
11. Openness Self	-1.076483	-0.2715
12. Openness Group	2.122171	-0.6240
13. Non Verbal	-0.002223	-0.0826
14. Self Awareness	-2.948509	-1.3551*

*The reader will note that when we take all fourteen vari-
ables as a group, that warmth and self awareness account
for the greatest amounts of variance.

Again, when we drop down to six variables, our F ratio
for the multivariate test of equality of mean vectors im-
proves. Here F = 7.7623 (d.f. = 6, 15 and P is less than
.0007) (see Table 5-6, on the following page).

In the discriminant analysis for six variables, our
variance of canonical variate 1 = 3.1049. Roy's criterion
(M=2, N-6.5) is 0.7564. Hotelling's Trace criterion is
3.1049. This time Bartlett's Chi Square test for significance
of successive canonical variates stays down (24.0072 with
d.f. = 6, P<0.0006). The canonical form of least squares
estimates of variates X effects is 3.492551. In other words,
when we select out those variables which the literature sug-
gested would be most closely associated with effective cross
cultural interaction, our significance jumps even higher.
We should note that we are also now considering fewer observ-
ations per group than people per group--a healthier statis-
tical measure.

Looking just at those six variables we see again how
powerful is the variable of self awareness (see Table 5-7 on
page 136).

The F ratio for the multivariate test of equality of
mean vectors improves as we move down to four recorded
variables (F=9 .8981, d.f.=4, 17 and P <.0003). Note the
contribution of self awareness when all other variables are
considered before it (see Table 5-8 on page 137).

TABLE 5-6. Second Analysis of Variance Using Six Variables

Variable	Univariate F	P Less Than	Step Down F	P Less Than
1. Self Awareness	28.0535	0.0001***	28.0535	0.0001***

6. Empathy Self	5.8740	0.0250**	1.9647	0.1814

(d.f. = 1, 20)

  *Significant where P < .10
 **Significant where P < .05
***Significant where P < .01

TABLE 5-7.   Discriminant Function Coefficients for Second
             Analysis, Six Variables

Variable	Raw Coefficient	Standardized
1. Self Awareness	1.657408	0.7617*
2. Self Esteem	0.064739	0.2467
3. Ambiguity	-0.016710	-0.0742
4. Dogmatism	-0.031849	-0.2840
5. Value Equality	-0.462884	-0.5090
6. Empathy Self	1.075294	0.4140

*Note the contribution of self awareness.

TABLE 5-8. Second Analysis of Variance, Four Variables

Variable	Univariate F	P Less Than	Stepdown F	P Less Than
1. Value Equality	6.4610	0.0195**	6.4610	0.0195
2. Dogmatism	9.2771	0.0064***	4.8508	0.0402
3. Ambiguity	3.7612	0.0067***	1.9561	0.1790
4. Self Awareness	28.0535	0.0001***	13.7347	0.0018***

(d.f. = 1, 20)
 *Significant, P $<$ .10
 **Significant, P $<$ .05
***Significant, P $<$ .01

Again, we note that in this ordering, self awareness is far and away the most powerful discriminator in explaining the variance of treatment versus control differences.

TABLE 5-9. Discriminant Function Coefficients for Second Analysis, Four Variables

Variable	Raw Coefficient	Standardized
1. Value Equality	-0.514120	-0.5653
2. Dogmatism	-0.021070	-0.1879
3. Ambiguity	-0.048367	-0.2147
4. Self Awareness	1.807291	0.8306*

*Note the contribution of self-awareness.

Here, the variance of canonical variate 1 was 2.3290. Roy's criterion (M=1, N=7.5) was .6996. Bartlett's Chi Square test for significance of successive canonical variates (21.6479, with d.f.=4) kept a low P value of less than .0003. The canonical form of least square estimates of variates X effects is 3.024813.

Summary of Treatment versus Control Analysis

For the purposes of our training model and the theoretical bases on which it was designed, the following observations are presented:

(a) Self awareness (the variable with which we were most concerned) proved to be the most powerful discriminator and accounted for the most variance, particularly in the second analysis.

(b) All fourteen variables were modified in the direction for which we hoped, although some did not move as much as we would have liked.

(c) Intolerance for ambiguity, as measured on the Budner Scale, proved to have been modified much less than originally anticipated.

(d) Regard for the value of equality was modified considerably considering the high ceiling effect we had on our control groups.

(e) Reduction of dogmatism proved more noticeable than we anticipated. The literature suggested that it would not move very much.

(f) Self esteem showed considerable gain when all 14 variables were analyzed together but proved less important in the analyses of six and four variables.

(g) Warmth as perceived by the group was a strong discriminator in the set of 14 variables.

(h) The ability to communicate non-verbally had a high univariate F ratio in both analyses but seemed to account for little in the overall variance. Until this instrument is validated and normed, it is felt that it would have little use in future research.

(i) Empathy as perceived by the individual has note-
worthy univariate F ratios in both treatment versus control
analyses but contributed less than expected in the overall
variance.

(j) Genuineness as perceived by the individual seemed
to discriminate well in the second analysis. It was rather
disappointing as a discriminator (self and group).

(k) Group openness had a mildly significant step down
F value on the first overall analysis but contributed less
than expected to the variance in both analyses.

(l) Going to four commonly accepted authorities we may
sum up our confidence levels with the following table (see
Table 5-8, on the following page).

Pre versus Post Measures
(Repeated Measure Analysis)

Two phases marked the pre versus post analysis. We used
the Jennrich program for analysis of variance for repeated
measures. This program will not take unequal cell sizes.
We thus had to randomly select six out of fourteen Spring
groups to match the six of Winter quarter.

However, once we established that there was no signifi-
cant effect by quarter, we could pool all groups, on pre
test scores and all groups on post test scores without regard
to the academic quarter in which the measurements were made.

The phases of this analysis of variance are reported
using the following model (Figure 5-4, on page 142).

TABLE 5-10. Four Tests for Significance in Treatment versus Control Analyses

Number of Variables	Test	P Value First Phase	P Value Second Phase
14	Multivariate F Ratio	<.1299	<.0289
	Roy's Criterion	<.1299	<.0289
	Hotelling's Trace (Σ non log roots)	<.1299	<.0289
	Bartlett's X^2	<.0457	<.0088
6	Multivariate F Ratio	<.0895	<.0007
	Roy's Criterion	<.0895	<.0007
	Hotelling's Trace	<.0895	<.0007
	Bartlett's X^2	<.0847	<.0006
4	Multivariate F Ratio	<.0928	<.0003
	Roy's Criterion	<.0928	<.0003
	Hotelling's Trace	<.0928	<.0003
	Bartlett's X^2	<.0906	<.0003
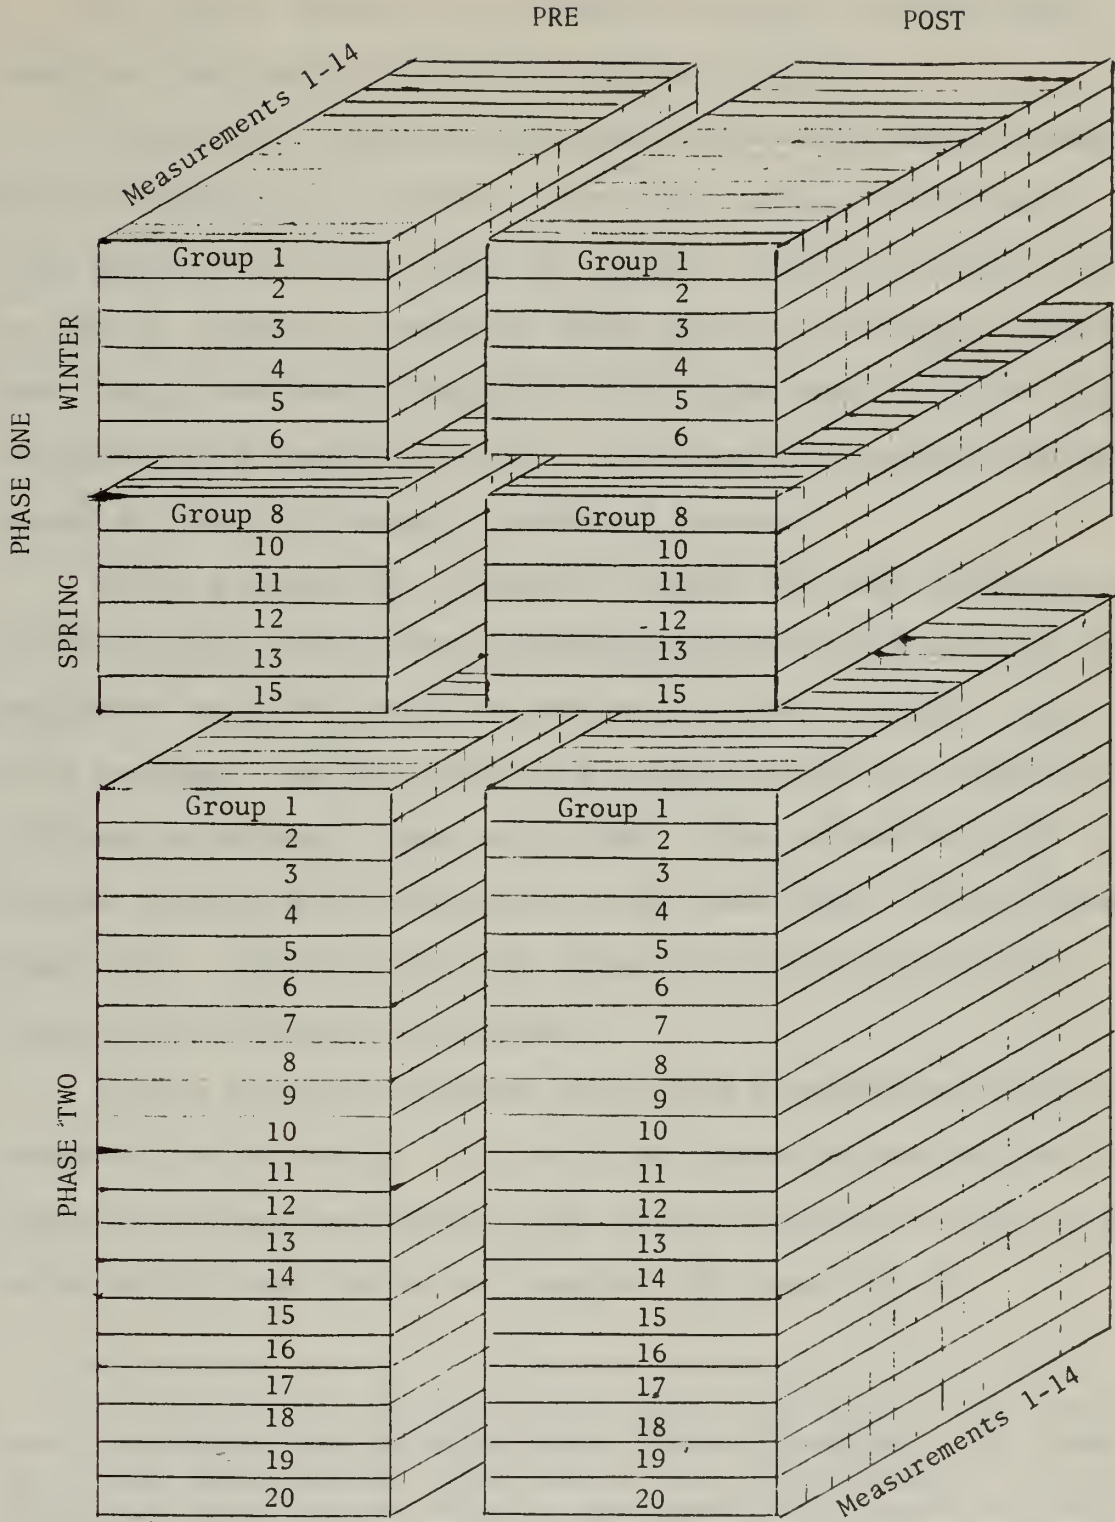

FIGURE 5-4.   Pre versus Post measures.

The first phase of the analysis showed the following results (see Table 5-11 on the following page).

Seeing that there is no significant difference between Winter and Spring quarters on pre test measures and post test measures, we are free to restore the group scores which we had to ignore in order to keep equal cell sizes, and to test again for the strength of the differences of time (pre and post) and measures (1-13).[1] We now had the pre and post measures from all twenty treatment groups.

Using a format by Jerome L. Myers[2] for the analysis of variance for a two factor repeated measurements design, we proceeded to test again for the main effect of Time. In this analysis, we are even more confident of the significant difference between $time_1$ and $time_2$. Our probability of chance related difference went from less than .025 to less than .005. Measures and the interaction of measures by times also had lower p values.

A note is also in order about the Greenhouse and Geisser conservative F tests. If the first phase of the pre vs. post analysis of variance could meet this conservative test, we could avoid even having to examine the equality of

---

[1]It should be mentioned that self awareness was dropped from consideration in both these phases because it is made up of the differences from each of the Truax pairs. To keep it in the analysis would have exaggerated our pre-post differences and possibly obscured the influence of other variables.

[2]Jerome L. Myers, Fundamentals of Experimental Design (Boston: Allyn and Bacon, 1967), p. 171.

TABLE 5-11. Analysis of Variance, Repeated Measures, First Phase

Sources of Variation	d.f.	MS	F Ratio	Significance*
Between Groups				
Quarters	1	14.295	.918	N.S.
(e) Groups within quarters	10	15.564

Quarter by Time	1	1
Time by Group within Quarter	10	10
Measure by Time	12	1
Quarter by Measure by Time	12	1
Measure by Time by Group within Quarter	120	10

Summary of Pre Treatment versus Post
Treatment Analysis

It is felt that these second results should be weighted along with the first treatment versus control analysis and that the resultant conclusion must be that there was a significant main effect between pre and post measurements of the model as a whole (see Table 5-13 on the following page).

TABLE 5-13. Second Analysis of Variance, Repeated Measures

Sources of Variation	d.f.	Mean Squares	F	Significance*
Times (Pre and Post)	1	664.249	13.928	p < .005
Groups x Times	19	47.690		
Measures	12	586.683	11.409	p < .005
Groups x Measures	228	51.422		
Measures x Times	12	319.906	6.274	p < .025
Measures x Times x Groups	228	50.983		

*Greenhouse and Geisser Conservative F Tests were used.

Because the Greenhouse and Geisser Conservation F Tests
were used, this meant using the following degrees of freedom
instead of the usual (see Table 5-14).

TABLE 5-14. Conservative Degrees of Freedom, Second Analysis

Source	Ordinary d.f.	Conservative d.f.
Times	1	1
Groups x Times	19	19
Measures	12	1
Groups x Measures	228	19
Measures x Times	12	1
Measures x Times x Groups	228	19

Using conservative limits to our alpha levels, we still
found strong main effects. The shapes of the pre and post
distributions were significantly different and their means
differed in the desired direction.

Analysis of the Relationship of Leadership
Style to Group Behavior

We mentioned earlier that each small group had two
facilitators. Records were made of how each facilitator
responded to the instrument designed by Wile. In this Group
Therapy Questionnaire (GTQ, Form C), twenty-one encounter
group situations are presented along with nineteen possible

responses for each situation. The respondent is encouraged to write in his own response if it is not among those listed.

These responses are coded into ratios which indicate the weight of a leader's response style. In our study, we collapsed these measures into three ratios made up of six measures.

(a) Non-directive versus directive

(b) Reassurance versus confrontation

(c) Group centered versus individual centered

Each facilitator responded to the instrument. Their responses are described in Appendix G. The scores of the two facilitators assigned to each group were combined and compared with the observed changes of that group in the course of ten weeks.

Again, in order to share a common matrix, transformed standard scores were used for the correlation with leadership style scores.

We were interested to know, for example, if leaders who were heavy "confronters" had higher association with groups who greatly increased openness. Or, for example, would those leaders who were strong on reassurance more noticeably effect growth in warmth or empathy?

We, therefore, ran some single correlations comparing nine selected behavioral changes with these six leadership characteristics. We reduced the number of behavioral changes

from fourteen to nine in order to reduce the likelihood of
getting some correlations just by chance. We based our
choices on the assumptions noted in Chapter Three. See
Appendix K for the matrix of those correlations.

There were only four correlations over the .5 level.
Directiveness of the leader was associated with improvement
of self esteem at the .51704 level. The remaining three
were inter-leadership correlations:

$\Bigl\{$Non-directive and confrontation   (.56746)
* $\Bigl\{$Directive and confrontation   (.50157)
$\Bigl\{$Directive and individual centered   (.50701)

Inasmuch as a correlation of even .56746 represents less
than 8% of the variance, it is felt that <u>in this study there
was no significant association between leadership style and
group performance</u>.

Summary of Analyses

It is confidently asserted that this training model pro-
duced measurable and significant differences on the variables
tested in this study. On the treatment versus control
analysis, four commonly accepted tests for multivariate
significance were used to confirm this finding. On the pre
versus post (repeated measures) phase the most conservative
degrees of freedom were employed to rigorously control our

---

*This may indicate that there are stronger, latent
variables which we have not as yet recognized.

alpha level.   Both phases showed results which indicate significant change.

The data from this study showed that self awareness, dogmatism, regard for the value of equality, empathy, self esteem and tolerance for ambiguity were the variables effected (in that order) most strongly.   There appears to be no significant correlation between leadership style and behavioral changes as tested in our variables of interest.

CHAPTER VI

SUMMARY, CONCLUSIONS, REFLECTIONS
AND RECOMMENDATIONS

We have tried to proceed inductively throughout this study, i.e., to begin with observations in the field and then conceptualize principles. We began with a statement of change agents' heterophily problems and some of their real-world background in history and current affairs. Only then did we go to the theoreticians and cross cultural interaction trainers for principles with which to build our training model. From that phase we attempted to measure in the real world among a limited population of students preparing for work in the inner city how that theoretically based model actually performed. Now that those hard data have been analyzed, we are ready to draw together a synthesis of theory and reality.

Summary

In our statement of the problem to be studied we said that we were concerned with the ability of change agents such as teachers, police, military advisers and others working abroad or in new subcultures at home to interact effectively with their host counterparts.

We said that the central problem was one of hetero-
phily--the "differentness" in cultural background of the
change agent and that of his hosts. We were not so much
concerned with the agent's strategy for change as his
ability to communicate well and warmly with his hosts.
From our review of the history of this problem and of the
literature pertaining to the problem, we attached weights to
the factors most necessary for effective cross cultural
interaction training. We said that in the order of their
importance we needed:

1. increased self awareness

2. increased empathy

3. increased tolerance for ambiguity

4. increased self esteem

5. lower dogmatism

6. higher regard for the value of equality.

When we designed and tested a training model for within-
training-experience changes, we found that our model was
most effective in:

1. improving self awareness

2. lowering dogmatism

3. increasing the regard for the value of equality

4. increasing empathy

5. increasing self esteem

6. increasing tolerance for ambiguity.

We made no predictions about how long these changes
would be retained after the training experience. We would
expect heavy efforts by administrators and peers to re-
socialize teachers and overseas change agents when they
returned from our training to their cross cultural forms
of work. Nor did we find a way to establish criterion levels
for the variables of interest. Future research may determine
the maximum desired level of self esteem, for example.

In this model we found no significant association be-
tween small group leadership style and observed changes in
the variables of interest.

We are not really sure which parts of the model produced
the desired changes. Nor do we know if the full ten weeks
of treatment were really necessary in the case of each
variable, or if a longer treatment period might have produced
further changes on some of them. Additional study will be
necessary to control treatment more closely for individual
variable changes and the function of time.

We are confident that this is a viable training model
for the population within which it was selected.

Conclusions

1. In this cross cultural interaction training model
self awareness is the factor most positively modified.

2. The factors following self awareness as most amenable
to treatment effects are: dogmatism, regard for the value of

equality, empathy (the ability to reverse roles), self esteem and tolerance for ambiguity.

3. All fourteen variables of interest showed monotonic main treatment effects.

4. Leadership styles of small group facilitators had negligible effect upon the observed changes in the measures of our fourteen variables of interest.

5. This training model will produce desired changes in interpersonal skills and attitudes among education students anticipating working in the inner city.

Reflections

In the past year, we have gathered some subjective opinions which may be of use to those who wish to undertake further research in this field.

Need for Structure

Perhaps because this study was conducted within the University and its participant-subjects were students long used to being told what to do and when to do it, there seemed to be a constant clamoring for more structure-- particularly in the early weeks. This need seemed to diminish among the facilitators and student-subjects over time.

Inasmuch as we were trying to increase tolerance for ambiguity and to encourage students to take responsibility for their own learning, it seemed very important to slack off on the structural reins rather quickly.

Facilitator Training

It is our feeling that the degree of unconditional warmth, mature judgment and enthusiasm of the facilitator is central to student interest and participation. We believe that our results were better in those groups where we had taken more time to prepare facilitators prior to the beginning of the course. Ongoing, weekly training sessions were important; but something seems to be needed to allay the anxieties of the facilitators before they even meet with their groups.

Cross Cultural Interaction

The community probes, the interviewing with strangers, the interracial confrontations and simulations seemed to be overshadowed in importance by the very real cross cultural interaction within each group. Any assumptions about black and white, middle class students--even from the same city-- sharing identical goals and mores soon vanished. The important steps seemed to include (a) recognizing differences, (b) pinning down the commonalities, and (c) acceptance of each other including those differences.

Transferability of Learning

We noted considerable transfer of what people seemed to have learned about themselves within the groups to what they reported learning in their relationships with room- mates, families, co-workers, and spouses. From the cross

cultural standpoint, what we would hope to have happen
for pre-embarkation training seemed to happen here. We
think that the probability is quite good that the learnings
with which we have been concerned are highly transferable.
We look forward to trying the model among other populations.

Use of the Non-Verbal Communication
Skill Instrument

As developed and used in this model, this instrument
seems to be a powerful discriminator of skill at communicat-
ing particular non-verbal messages. The messages were those
of primary interest in a classroom. It is, however, an
expensive tool. It required using at least one set of video
tape recording equipment per 75 students and the time for
a panel of judges to score both the pre and post video tapes
of each group of participants. The author does not feel
inclined to use this instrument in the field because of its
expense in money and time. It did assist in feedback to the
students, however.

Heterophily in Student Groups

Subjective observations indicated that the more hetero-
philous a student group was in racial and social composition,
the more difficult were the early stages of adjustment, but
the further the group members progressed in comparison to
students in more homophilous groups. Increased regard for
the value of equality, increased self awareness and reduced

dogmatism were more pronounced in the heterophilous student groups.

Selection of Leaders and Groups

Apparent warmth and good judgment remain the author's prime criteria for the selection of facilitators. Previous counseling experience appeared to help in diagnosis but to have little effect in the ability to facilitate group inter- action. In five groups, clinical psychology background of the facilitators appeared to be counterproductive in terms of their ability to relate openly to their groups. They seemed to confine their role to observer and "helper" rather than openly share their own feelings.

It seemed in two out of fifty-six cases that facili- tators used the groups for their own personal therapy. When this happened to the degree that the facilitator was no longer aware of cues and/or was ignoring the needs of other people in the group, and when guidance proved ineffective, it seemed best to replace that facilitator.

The use of milling as a way of selecting groups is, as of this moment, the most desirable way to achieve student involvement in decisions about group composition. The author looks forward to other methods being developed. It is usually an uncomfortable phase of the training.

Support Services

There is a considerable amount of administrative support needed to arrange schedules, find adequate meeting facilities,

make community liaison for probes and interviews, score and record measurements, etc. There is also a need to be available to those students who wish to "work out" problems which cannot wait for their group's next meeting. A more ideal ratio of staff to handle 150 students at a time would appear to be three half-time instructors, thirty facilitators taking training and the equivalent of a full-time secretary in student labor, work study, etc.

Follow-up Courses

At the University there is an apparent demand among a growing number of students for courses like the one employed in this model. At the end of ten weeks most students feel that they are just beginning to see the potentials, just starting to experience the zest of being responsible for their own learning. It is felt that year-round courses could easily be scheduled and that they would provide increasing relevance to the student groups. Facilitators also seem to welcome the chance of a second ten-week experience. They appear to be more relaxed in their second attempt.

Future Measures of Interest

If this study is to be replicated in another environment and time, it is felt that a useful measurement continuum might be the degree of inner-directedness versus outer-directedness of the learner. If the author were doing this study again he would look more closely at this variable of

control and compliance, i.e., whether we look within our-
selves or outside ourselves for the basis of our decision
making in cross cultural dilemmas.

Future Treatments Needed

The most vexing variable to this writer is that of
tolerance for ambiguity. Fresh approaches to increase
tolerance for ambiguity are urgently needed.

We also need experimentation in in-service reinforce-
ment experiences to hold and improve upon the gains we have
made.

Recommendations

It has often been said in university circles (and often
heard recently among advisors in South Vietnam) that the
only thing we learn from history is that we do _not_ learn
from history. If we are to short circuit our apparent drive
to communicate contemptuously overseas or condescendingly
and patronizingly toward indigents at home, we desperately
need to invest thought, money and energy into more rigorous
forms of training of those change agents whom we sponsor for
those roles.

It taxes our comprehension that businesses could con-
tinue to send executives and salesmen overseas without a
minute's preparation, that diplomats and AID officials receive
more training in American administrative procedures than they

do in language or interpersonal skills, that WASP teachers presume to teach with ease in the inner city without vigorous interaction training, or that military advisors go forth with so little self awareness of how they are being perceived by their counterparts.

It is not as if we have no empirical evidence that this flow of contempt can be altered--if not terminated. Behavioral changes in interpersonal skills have been verified in research by the Peace Corps, the Human Resources Research Office, the Third Marine Amphibious Force, and in studies such as this, and that of Todd Eachus (see Chapter III).

To have some knowledge and some skill to rectify a pressing problem and to not apply that knowledge and skill seems to approach criminal negligence. The following recommendations are therefore submitted.

The University

It is felt that each university sending faculty overseas for consultation or research should first enjoin said faculty members to participate in a training experience similar to that presented in this study.

It is strongly urged that courses in interpersonal skills be continued and expanded in the colleges of education, social science, and human ecology, and that every student anticipating work in a culture or subculture foreign to his own be encouraged to enroll in at least one of those courses.

The Military

It is strongly recommended that all military personnel who are ordered overseas be given both a pre-deployment training experience and an in-country set of reinforcing experiences in interpersonal skills. Culture shock should be anticipated, located and treated before we turn more "neutrals" and "allies" into enemies.

There is also an urgent need to help military leaders of whatever race to communicate more effectively with members of other races within the military establishment.

Other Agencies Sponsoring Change Agents
Overseas

A systematic approach is critically needed to improve the interpersonal skills of technical and business represen- tatives going overseas. Sanctions such as training qualifi- cations for visas and/or passports might be considered.

It is probably too big an immediate task to consider enforcing such a training requirement upon all tourists. Hopefully, as purposeful affective learning experiences de- signed to increase empathy and self awareness are generated through our school systems, businesses and the military, our larger population will become more welcome guests in other lands.

This very real question will stare at us for decades to come. Are we, the citizens of the United States, perceptive, empathic and human enough to peacefully coexist with human beings of other cultures?

APPENDICES

APPENDIX A

ROKEACH VALUE INVENTORY

VALUE INVENTORY*

Here is a list of values. The list is in alphabetical order.
Change the ranking to match your own ranking by placing the
letter of each value in the right hand column. The top
    space should have the letter of the value which is most
important to you. Put only one letter in a space--no ties.
Feel free to erase or to rearrange your list.

			RANK ORDER:
A - AESTHETICS	(appreciation of the arts, nature, one's own appearance, beauty)		____
B - EQUALITY	(the treatment of others as equally important human beings)		____
C - FREEDOM	(independence, self respect, freedom from overwhelming anxieties)		____
D - HEALTH	(physical and emotional health, inner harmony, absence of pain)		____
E - HONESTY AND JUSTICE	(personal integrity and fairness)		____
F - MATERIAL WEALTH/POWER	(freedom from want, affluence, security and comfort)		____

APPENDIX B

ROKEACH DOGMATISM SCALE

D-Scale

Student Number _____   Date _____

Instructions

Please mark each statement in the left margin according to how much you agree or disagree with it. Please mark every one.

Write +1, +2, +3, or -1, -2, -3, depending on how you feel in each case.

+1:	I AGREE A LITTLE	-1:	I DISAGREE A LITTLE
+2:	I AGREE ON THE WHOLE	-2:	I DISAGREE ON THE WHOLE
+3:	I AGREE VERY MUCH	-3:	I DISAGREE VERY MUCH

Score

_____1. The United States and Russia have just about nothing in common.

_____2. The highest form of government is a democracy and the highest form of democracy is a government run by those who are most intelligent.

_____3. Even though freedom of speech for all groups is a worthwhile goal, it is unfortunately necessary to restrict the freedom of certain political groups.

_____4. It is only natural that a person would have a much better acquaintance with ideas he believes in than with ideas he opposes.

_____5. Man on his own is a helpless and miserable creature.

_____6. Fundamentally, the world we live in is a pretty lonesome place.

_____7. Most people just don't give a "damn" for others.

_____8. I'd like it if I could find someone who would tell me how to solve my personal problems.

_____9. It is only natural for a person to be rather fearful of the future.

_____10. There is so much to be done and so little time to do it in.

_____11. Once I get wound up in a heated discussion I just can't stop.

_____12.   In a discussion I often find it necessary to
            repeat myself several times to make sure I am
            being understood.

_____13.   In a heated discussion I generally become so ab-
            sorbed in what I am going to say that I forget to
            listen to what the others are saying.

_____14.   It is better to be a dead hero than to be a live
            coward.

_____15.   While I don't like to admit this even to myself,
            my secret ambition is to become a great man, like
            Einstein, or Beethoven, or Shakespeare.

_____16.   The main thing in life is for a person to want to
            do something important.

_____17.   If given the chance I would do something of great
            benefit to the world.

_____18.   In the history of mankind there have probably been
            just a handful of really great thinkers.

_____19.   There are a number of people I have come to hate
            because of the things they stand for.

_____20.   A man who does not believe in some great cause
            has not really lived.

_____21.   It is only when a person devotes himself to an
            ideal or cause that life becomes meaningful.

_____22.   Of all the different philosophies which exist in
            this world there is probably only one which is
            correct.

_____23.   A person who gets enthusiastic about too many causes
            is likely to be a pretty "wishy-washy" sort of
            person.

_____24.   To compromise with our political opponents is
            dangerous because it usually leads to the betrayal
            of our own side.

_____25.   When it comes to differences of opinion in religion
            we must be careful not to compromise with those
            who believe differently from the way we do.

_____26.   In times like these, a person must be pretty selfish
            if he considers primarily his own happiness.

_____27. The worst crime a person could commit is to attack publicly the people who believe in the same thing he does.

_____28. In times like these it is often necessary to be more on guard against ideas put out by people or groups in one's own camp than by those in the opposing camp.

_____29. A group which tolerates too much differences of opinion among its own members cannot exist for long.

_____30. There are two kinds of people in this world: those who are for the truth and those who are against the truth.

_____31. My blood boils whenever a person stubbornly refuses to admit he's wrong.

_____32. A person who thinks primarily of his own happiness is beneath contempt.

_____33. Most of the ideas which get printed nowadays aren't worth the paper they are printed on.

_____34. In this complicated world of ours the only way we can know what's going on is to rely on leaders or experts who can be trusted.

_____35. It is often desirable to reserve judgment about what's going on until one has had a chance to hear the opinions of those one respects.

_____36. In the long run the best way to live is to pick friends and associates whose tastes and beliefs are the same as one's own.

_____37. The present is all too often full of unhappiness. It is only the future that counts.

_____38. If a man is to accomplish his mission in life it is sometimes necessary to gamble "all or nothing at all."

_____39. Unfortunately, a good many people with whom I have discussed important social and moral problems don't really understand what's going on.

_____40. Most people just don't know what's good for them.

APPENDIX C

BUDNER'S SCALE
FOR INTOLERANCE OF AMBIGUITY

COMPLEXITY SCALE

Please use the following scale to record your feelings about the items listed below:

1. Disagree very strongly
2. Disagree
3. Slightly disagree
4. Uncertain

5. Slightly agree
6. Agree
7. Strongly agree

1. An expert who doesn't come up with a definite answer probably doesn't know too much   _____

2. There is really no such thing as a problem that can't be solved.   _____

3. A good job is one where what is to be done and how it is to be done are always clear.   _____

4. In the long run it is possible to get more done by tackling small, simple problems rather than large and complicated ones.   _____

5. What we are used to is always preferable to what is unfamiliar.   _____

6. A person who leads an even, regular life in which few surprises or unexpected happenings arise, really has a lot to be grateful for.   _____

7. I like parties where I know most of the people more than ones where all or most of the people are complete strangers.   _____

8. The sooner we all acquire similar values and ideals the better.   _____

9. I would like to live in a foreign country for a while.   _____

10. People who fit their lives to a schedule probably miss most of the joy of living.   _____

11. It is more fun to tackle a complicated problem than to solve a simple one.   _____

12. Often the most interesting and stimulating people are those who don't mind being different and original.   _____

13. People who insist upon a yes or no answer just don't know how complicated things really are.   _____

14. Many of our most important decisions are based upon insufficient information.   _____

15. Teachers or supervisors who hand out vague assignments give a chance for one to show initiative and originality.   _____

16. A good teacher is one who makes you wonder about your way of looking at things.   _____

APPENDIX D

HUNT'S LOW SELF-ESTEEM SCALE

NAME_____

DATE_____

HUNT SCALE

Check the response which comes closest to how you are feeling right now.

	Strongly Agree	Agree	Uncertain	Disagree	Strongly Disagree
I am a quick thinker...............					
When I do a job, I do it well........					
I am usually alert.					
When I make plans ahead, I usually get to carry out things the way I expected.					
I am good at remembering things......					
As a spouse (close friend), I do a good job these days					
I feel the future looks bright.......					
I am a useful person to have around.					
I'm inclined to feel that I'm a failure...........					
I sometimes feel that my life is not very useful.......					
I feel as though nothing I do is any good..............					
Basically, I am quite attractive to the opposite sex...					

APPENDIX E

TRAUX SCALES
FOR EMPATHY, WARMTH, GENUINENESS AND OPENNESS

TRAUX SCALES FOR EMPATHY, WARMTH, GENUINESS AND OPENNESS
(1-5 each item)

Please rate everyone in the group, including yourself, and
sign at the bottom.   OK?

NAME	EMPATHY	GENUINE-NESS	WARMTH	OPEN-NESS	TOTAL
1					
2					
3					
4					
5					
6					
7					
8					
9					
10					
11					
12					

Empathy: 1. completely unaware of other's feelings, appears
bored.
2. get some messages but don't indicate interest.
3. respond accurately to exposed feelings, not to
hidden feelings.
4. ok on exposed feelings, some probing, not en-
tirely "with" the other person.
5. respond accurately to nearly all feelings
seriously and in depth.

Genuineness: 1. very defensive, great distance between real
and expressed feelings.
2. respond appropriately but formally, seem to be
playing a role.
3. send confusing, double messages about where we
really are.
4. more often than not very genuine, hardly ever a
facade.
5. freely and deeply ourselves, transparent in
pleasant or hurtful feelings.

Non-possessive warmth: 1. preach, give advice, give clear
negative regard.
2. respond mechanically, remain passive when other
is deeply moved.

3. positive regard but semi possessive or condi-
   tional.
4. deeper interest, conditions or reservations on
   deeper levels.
5. warmth without restriction.

Openness: 1. disclose nothing about ourselves, put subject
   into third person.
2. disclose only things which "slip out".
3. let friends know our opinions when asked.
4. include some opinions with statements without
   being asked.
5. live almost entirely at the opinion level,
   unable to repress feelings.

APPENDIX F

NON-VERBAL COMMUNICATION
SKILLS ASSESSMENT INSTRUMENT

NON-VERBAL COMMUNICATION

SKILLS ASSESSMENT INSTRUMENT

I. Students are randomly assigned to one of three message
   groups (A, B, or C). A reader asks each student to
   communicate non-verbally, before a video tape recorder,
   six messages. The reader sits in front of the student
   and reads one of the following message groups:

   A. 1. Tell me, "Hello".
      2. Ask me, "Why"?
      3. Get my attention.
      4. Show me you disapprove.
      5. Tell me you like me.
      6. Ask me to repeat what I just said.

   B. 1. Tell me you're glad to be here,
      2. Say, "Thank you".
      3. Tell me to cool it.
      4. Ask me, "Where"?
      5. Get the attention of everyone.
      6. Show me you approve of me.

   C. 1. Tell me you approve of what I just said.
      2. Ask me, "How"?
      3. Tell me to come to the front of the room.
      4. Get me to sit down.
      5. Tell me you don't like what I just said.
      6. Tell me you're glad that I'm here.

II. The responses are recorded and then edited in random
    order. A panel of six judges, felt to be skilled in
    non-verbal communication, will review the tapes,
    scoring one point for each message correctly communi-
    cated and up to four points for strength of the
    messages. The range of possible scores is 0 to 360.

III. On the posttest each student is given the same set of
     messages to communicate. His responses are edited
     randomly with the pre-tests and judged by the panel
     of judges. Attention is given to total loss or gain
     in the test scores.

APPENDIX G

GROUP THERAPY QUESTIONNAIRE

FORM C[1]

GTQ--FORM C[1]

This questionnaire presents twenty-one situations which sometimes occur in human interaction groups and asks you to indicate how you would respond if you were the leader in the group. A list of nineteen alternative responses is provided for each situation.

For each situation:

a. List (in Column 1) the numbers of __all__ the responses among the nineteen that you might consider making if you were the leader faced with this particular situation.

b. Then, choose from among your selections, the __one__ response which you feel is most important to make, and write its number in Column 2.

c. Column 3 is for responses you might make which have not been included on the list.

---

[1]Form C, prepared by Daniel B. Wile, is an experimental modification of Form B of the GTQ, which was originally developed by Daniel B. Wile and Gary D. Bron.

Situation 1:   starting the group

You are the leader in a group which is meeting today
for the first time. All eight members, young adults, are
present as you enter the room and sit down. You introduce
yourself and the members introduce themselves. Then every-
one turns and looks at you expectantly. There is silence.
What do you do?

1. Do nothing.

2. Say that the group is theirs to make use of as they
    wish.

3. Reassure them that a certain amount of tension is
    typical in the beginning of a group.

4. Break the ice with casual conversation.

5. Describe the purposes and procedures of the group.

6. Say that everyone seems so uptight that you wonder if
    the group is going to get off the ground.

7. Ask how they feel in this first meeting (about being
    in the group or about each other).

8. Say how you are feeling (example: tense and expectant).

9. Share an experience in your own life.

10. Ask why everyone is silent.

11. Ask what they think might be going on in the group.

12. Describe how they seem to be expecting you to start
     things.

13. Suggest that they are wanting you to be an inspirational
     and protective leader.

14. Describe the silence as an expression of their anxieties about the group.

15. Ask everyone to say why he came to the group.

16. Lead into a discussion of their family relationships and past experiences.

17. Encourage them to discuss their goals in behavioral terms.

18. Use a nonverbal procedure (examples: milling around; focusing on bodily tensions).

19. Use a role playing or psychodrama procedure (example: encourage a member to act out one of his problems).

Situation 2: personal questions

Near the beginning of the first meeting, the members ask you personal questions about your family and background. What do you do?

1. Do nothing.

2. Invite them to say what they think your answers to these questions might be.

3. Say that you can understand why they might be curious about you.

4. Avoid answering the questions without drawing attention to the fact that you are not answering--bring up another issue.

5. Say that you cannot see how this information would be of any use to the group.

6. Say that it is none of their business.

7. Ask how they feel about you and about the way the group has been set up.

8. Say how you are feeling about their questioning (example: uncomfortable).

9. Answer the questions.

10. Ask why they are asking these questions.

11. Ask what they think might be going on in the group at the moment.

12. Describe how the group's attention has become concentrated upon you.

13. Describe these questions as an expression of their concern about what is going to happen between you and them.

14. Suggest that you may be asking about you to avoid talking about their own thoughts and feelings.

15. Encourage them to talk about themselves.

16. Lead into a discussion of their family relationships and past experiences (example: ask if they would like to answer these same questions about themselves).

17. Encourage them to consider behavior they may wish to change.

18. Ask them to express nonverbally how they feel about you and the group.

19. Ask one of the members to role play your position in the group.

Situation 3:   the chairman

Later in this first session, someone suggests that the group appoint a chairman to conduct the meetings. This idea is received enthusiastically. They explain that this will permit the group to function in a more orderly fashion. Everyone appears to agree with the idea. What do you do?

1.   Do nothing.

2.   Say that you are willing to go along with whatever the group decides about this.

3.   Agree that it is worth a try.

4.   Direct attention away from this idea by bringing up another issue.

5.   Recommend against the idea.

6.   Say, "It's beginning to sound like a PTA meeting in here--I guess no one is really interested in group interaction."

7.   Ask how they feel about the way the group has been set up.

8.   Say how you are feeling about the discussion.

9.   Share a similar experience in your own life.

10.   Ask why it is important for the group to function "in an orderly fashion".

11.   Say, "What happened that made us decide we need a chairman?"

12.   Describe the group's feeling of enthusiasm about the idea.

13. Suggest that their interest in a chairman may be a way
    of dealing with the ambiguity of the group situation.

14. Interpret their discussion as resistance to becoming
    involved in the group.

15. Encourage them to talk about themselves.

16. Lead into a discussion of their family relationships
    and past experiences.

17. Encourage them to consider behavior they may wish to
    change.

18. Ask them to express nonverbally how they feel about
    you and the others.

19. Ask them to role play how the group would be with a
    chairman.

Situation 4: a filibuster

The group spends much of the second session talking
about politics. No one appears displeased with the discus-
sion and it looks like it may continue for the remainder of
the meeting. What do you do?

1. Do nothing.

2. Ask if they are satisfied with how the group is going
   today (say, "Is this really the way you want to use the
   time?").

3. John in on the discussion.

4. Try to draw them into a more meaningful discussion
   without criticizing what they are doing.

5. Suggest that they talk about more immediate things.

6. Describe their discussion as cocktail party chatter.

7. Ask how they feel about what has been going on.

8. Say how you are feeling (example: bored).

9. Share an experience in your own life.

10. Ask why they are talking about politics.

11. Ask what they think might be going on in the group today.

12. Describe the group mood of avoidance and withdrawal.

13. Suggest that their interest in politics may have something to do with their concern about the inter-relationship--or "politics"--within the group.

14. Suggest that they are discussing politics to avoid talking about more immediate thoughts and feelings.

15. Encourage them to talk about themselves.

16. Lead into a discussion of their family relationships and past experiences.

17. Encourage them to consider behavior they may wish to change.

18. Use a nonverbal procedure to get things going.

19. Use a role playing or psychodrama procedure.

Situation 5: an attack upon the leader

After spending much of this second meeting talking about dieting and politics, the group suddenly turns on you, accusing you of being uninvolved, distant, and uncaring. What do you do?

1. Do nothing.

2. Say that it is up to them what happens in group, not you.

3. Talk in an approving way about the directness and honesty with which they are able to say how they feel.

4. Direct attention away from their attack by bringing up another issue.

5. Defend yourself--say that you do not see yourself as uninvolved and uncaring.

6. Describe them as a group of whiny complainers.

7. Ask how they feel when they are criticizing you in this way.

8. Say how you are feeling.

9. Share an experience in your own life.

10. Ask why they suddenly became angry at you.

11. Ask what they think might be going on in the group today.

12. Describe the group attitude of dissatisfaction with you.

13. Suggest that they are disappointed that you are not the inspirational and protective leader that they had wanted you to be.

14. Describe how you may be a scapegoat for their dissatisfaction with their own participation in the group.

15. Encourage them to relate this to what is happening in their lives outside the group.

16. Lead into a discussion of their family relationships and past experiences (example: suggest that you may be reminding them of people they have known).

17. Encourage them to use this situation to consider behavior they may wish to change.

18. Use a nonverbal procedure (example: arm wrestling).

19. Suggest that they role play both how they see you and how they would want you to be.

Situation 6: a group silence

The third meeting begins with a silence. Several minutes pass and still no one says anything. It is beginning to look like the silence might continue for some time. What do you do?

1. Do nothing.

2. Ask if they are satisfied with how the group is going today.

3. Say that silences are often productive.

4. Help the group get started without making a special point about their silence (ask questions or bring up things to talk about).

5. Say that they are wasting time.

6. Remark that they look pretty foolish, sitting around waiting for someone else to say something.

7. Ask how they feel when everyone is silent.

8. Say how you are feeling or, possibly, laugh at the absurdity of the situation.

9. Share an experience in your own life.

10. Ask why everyone is silent.

11. Ask what they think might be going on in the group today.

12. Say that it seems that no one wants to talk today.

13. Say that each person appears to have resolved not to be the first to speak.

14. Interpret their silence as an expression of resentment about how the group is going.

15. Encourage them to talk about themselves.

16. Lead into a discussion of their family relationships and past experiences.

17. Encourage them to consider behavior they may wish to change.

18. Encourage them to express themselves nonverbally.

19. Use a role playing or psychodrama procedure to get things going.

Situation 7: a distressed woman

Later in this third meeting, one of the women describes how her boyfriend just told her that he wants to break off their relationship. She seems quite upset, skipping from one idea to another, and returning repetitively to the same few despairing thoughts. She has been looking directly at

you from the beginning of her remarks, ignoring the rest
of the group. When she finishes talking, she asks for your
comments. What do you do?

1. Do nothing.

2. Redirect her question to the group (ask how the group
    might be able to help her).

3. Express interest in her and concern about her diffi-
    culties.

4. Try to draw the others into the discussion without
    making a point of the fact that she had left them out.

5. Suggest that she ask the group rather than you.

6. Accuse her of basking in self pity.

7. Ask the members how they feel about what is going on.

8. Say how you are feeling.

9. Share a similar experience in your own life.

10. Ask why she is asking you.

11. Ask what they think might be going on in the group
    today.

12. Describe how the group has accepted the role of passive
    observer.

13. Suggest that her appeal for your undivided attention
    may be an attempt to regain the feeling of being
    valued--special--which she lost when her boyfriend
    rejected her.

14. Suggest that her preoccupation with being rejected is a
    way of not having to consider her own participation in
    the breakup.

15. Talk about her problems with her boyfriend, leading perhaps to a general exploration of her problems with intimacy.

16. Encourage her to relate this to her family relationships and past experiences.

17. Encourage her to discuss her problem in behavioral terms.

18. Use a nonverbal procedure to get at her underlying feelings.

19. Use a role playing or psychodrama procedure to obtain a more here and now expression of what happens with her boyfriend.

Situation 8: the late arrival

It is the fourth meeting. One woman makes a dramatic entrance fifteen minutes late. Although she has done this before, no one says anything about it. What do you do?

1. Do nothing.

2. Ask why no one says anything about her coming late.

3. Give her attention and express interest in her.

4. Continue as if nothing out of the ordinary were happening.

5. Suggest that she try to get to the group on time.

6. Accuse her of acting like a prima donna--coming to the group late so that she can make a dramatic entrance with everyone watching.

7. Ask her and the rest of the group how they feel about her coming late.

8. Say how you are feeling.

9. Share a similar experience in your own life.

10. Ask her why she comes late.

11. Ask how her coming late might be related to what has been going on in the group as a whole.

12. Mention that she has been late several times.

13. Suggest that her role in the group involves making a grand entrance with everyone watching.

14. Suggest that she comes to the group late in order to deny the important role that it plays in her life.

15. Ask if she usually comes late to things (perhaps this is the way she deals with situations).

16. Encourage her to relate this to her family relationships and past experiences.

17. Encourage her to use this situation to consider behavior she may wish to change.

18. Use a nonverbal procedure to get at the underlying feeling.

19. Ask another member to role play her entrance.

Situation 9: the monopolizer

For several meetings now the conversation has been monopolized by one of the women. Her monologues and interruptions interfere with the development of any kind of

meaningful interchange. It is now part way into the fourth meeting. She has had the floor for most of this hour also. What do you do?

1. Do nothing.

2. Ask why they are letting her monopolize.

3. Talk in an approving way about the freedom with which she is able to assert herself in the group.

4. Direct remarks to the others in an attempt to increase their participation.

5. Suggest that she limit her comments for awhile to give others a chance.

6. Describe her as a longwinded and insensitive bore who always has to be in the spotlight.

7. Ask how they feel about one person doing most of the talking.

8. Say how you are feeling (example: irritated with her).

9. Share a similar experience in your own life.

10. Ask her why she is monopolizing.

11. Ask how they would describe what has been going on in this meeting.

12. Comment on the group's attitude of passive resignation to what is going on.

13. Describe what is going on as a two party interaction where she monopolizes while the others allow and perhaps even encourage her to do it.

14. Describe her need to control as a defense against her fear of being controlled or overwhelmed.

15. Ask if this kind of thing happens with her outside the group.

16. Encourage her to relate this behavior to her family relationships and past experiences.

17. Encourage her and the rest of the group to use this event to consider behavior they may wish to change.

18. Use a nonverbal or gestalt therapy procedure to get beyond her verbal defenses.

19. Ask another member to role play how she behaves in the group.

Situation 10: the quiet member

One of the men has said very little throughout the meetings, although he seems to follow with interest everything that has been happening. It is now the middle of the fourth session and some of the others are finally beginning to question him about his silence. He remains basically uncommunicative, however, and the group seems uncertain how to pursue the matter. What do you do?

1. Do nothing.

2. Even if they look to you for help, leave it to the group to deal with the situation.

3. Say that each person is free to decide when he wants to talk adding that you would like to hear from him when he does feel like talking.

4. Encourage him to speak but without making a point of his silence (example: ask for his opinion about the group).

5. Tell him that he is not going to get much out of the group if he does not put much into it.

6. Try to get him to react (example: accuse him of being a parasite, sitting back and living off others).

7. Ask how he feels about what the group is saying to him and ask how they feel about his reaction to their remarks.

8. Say how you are feeling.

9. Share a similar experience in your own life.

10. Ask him why he has been silent and ask the others why they object to his silence.

11. Ask how they would describe what has been going on in the group today.

12. Describe how the group seems uncertain how to discuss this with him.

13. Describe the nonverbal ways in which he interacts with others--eye contact, laughter, attentive expression.

14. Interpret his silence as an expression of tenseness and anxiety about the group.

15. Encourage him to talk about himself (example: ask if he is usually quiet in group situations).

16. Encourage him to relate his behavior to his family relationships and past experiences.

17. Encourage him to use this situation to consider be-
    havior he may wish to change.

18. Encourage him to express himself nonverbally.

19. Ask him to role play an important situation in his
    life.

Situation 11: a threat to quit

Near the beginning of the fifth meeting, one of the
women announces that she is going to quit the group. The
others are upset by this and try to talk her out of it.
She remains resolute, however, and stands up to leave. She
pauses briefly at the door, as if waiting to see if anyone
has any final comments. The others just sit there, not
knowing what to do. What do you do?

1. Do nothing.

2. Ask what they want to do about the situation.

3. Say that you have enjoyed her being in the group and
   would be sorry if she left.

4. Draw her into a conversation without making an issue
   of the fact that she was about to leave.

5. Suggest that she give the group more of a try before
   making any final decisions.

6. Accuse her of using an obvious play to get the attention
   of the group.

7. Ask her and the group how they feel about her leaving.

8. Say how you are feeling (example: abandoned).

9. Share a similar experience in your own life.

10. Ask why she wants to leave now, right in the middle
    of the meeting.

11. Ask how her wanting to leave might be related to what
    is happening in the group as a whole.

12. Describe how everyone seems confused and uncertain what
    to do.

13. Interpret their concern and confusion about her leaving
    as a fear that this may be the beginning of the dissolu-
    tion of the whole group.

14. Suggest that she wants to stop because she is afraid of
    becoming involved in the group.

15. Ask if this kind of thing has happened with her before
    (perhaps quitting is her way of dealing with threaten-
    ing situations).

16. Encourage her to relate her desire to quit to her
    family relationships and past experience (perhaps the
    group reminds her of her family situation).

17. Encourage her and the others to use this event to con-
    sider behavior they may wish to change.

18. Ask her to express nonverbally how she feels toward
    each member.

19. Use a role playing or psychodrama procedure.

Situation 12

Later in this fifth meeting, one of the men talks about
his marital problems. The others offer numerous suggestions.

He listens to each of them one at a time and then explains
why that particular suggestion will not work. What do you do?

1. Do nothing.

2. If they ask your opinion, reflect the question back to
    the group.

3. Show interest in him and express concern about his
    difficulties.

4. Seeing the interaction as a stalemate, bring up another
    issue for discussion.

5. Describe the interaction as a stalemate and suggest that
    they talk about something else.

6. Criticize him for not seriously considering his problem
    and wasting the group's time.

7. Ask how he feels about the group response to his problem
    and ask how they feel about his reaction to their sug-
    gestions.

8. Say how you are feeling.

9. Share a similar experience in your own life.

10. Ask him why he rejects all their suggestions and ask
    them why they are giving so much advice.

11. Ask what they think is going on in the group today.

12. Describe the eagerness with which they are giving him
    advice.

13. Describe how he asks for help and then rejects all
    the suggestions.

14. Describe how he is the focus around which all the other members are projecting their own problems--suggest that their advice may have more to do with them than it does with him.

15. Try to help him understand what happens between him and his wife.

16. Encourage him to relate this to his family relationships and past experiences (perhaps his difficulties with his wife have something to do with his feelings toward his mother).

17. Encourage him to talk about the problem in behavioral terms.

18. Use a nonverbal procedure.

19. Use a role playing or psychodrama procedure to obtain a more here and now expression of what happens with his wife.

Situation 13: the return of the absent member

A member who had been absent the two previous meetings arrives on time for the sixth meeting. It is now well into this meeting and neither he nor any of the others has mentioned his absences. What do you do?

1. Do nothing.

2. Ask why no one has said anything about his absences.

3. Say that it is good to see him again, that you were concerned when he missed two meetings that he might have drooped out of the group entirely.

4. Seeing his absences as a sign of lack of involvement with the group, try to draw him into the group conversation, but without referring to these absence.

5. Talk about the importance of coming to every meeting.

6. Comment on his half-hearted commitment to the group-- say that you doubt that he has ever really been committed to anything.

7. Ask him and the others how they feel about his returning after missing two meetings.

8. Say how you are feeling.

9. Share a similar experience in your own life.

10. Ask him why he missed these two meetings.

11. Ask how his missing two meetings might be related to what has been going on in the group as a whole.

12. Mention that he missed the two previous meetings.

13. Say that there seems to be an unspoken compact among the members not to talk about such events.

14. Interpret his absence as an expression of anxiety about the group.

15. Ask him what is happening in his life which may have caused him to miss those two meetings.

16. Encourage him to relate his absences to his family relationships and past experiences.

17. Encourage him to use this event to consider behavior he may wish to change.

18. Use a nonverbal procedure to get at the underlying feelings.

19. Ask him to role play an important situation in his life.

Situation 14: a member cries

It is the middle of the sixth meeting. A woman who had been usually silent for the first half of this meeting, makes a brief attempt to fight back tears and then begins to cry. No one says anything about it. What do you do?

1. Do nothing.

2. Ask why no one has said anything about the fact that someone is crying.

3. Express concern and reassurance.

4. Continue as if nothing out of the ordinary were happening.

5. Suggest that it might be more useful for her to talk than just to cry.

6. Accuse her of putting on a show.

7. Ask about feelings(examples: encourage her to give words to her feelings; ask the members how they feel about her crying).

8. Say how you are feeling (examples: moved, embarrassed).

9. Share a similar experience in your own life.

10. Ask her why she is crying (ask what's the matter).

11. Ask them to describe what is happening at that meeting.

12. Say that someone in the group is crying.

13. Describe her crying as an act of involvement in the group and a willingness to share her more private feelings with them.

14. Suggest that she may feel that the only time people are willing to listen and pay attention to her is when she is crying.

15. Encourage her to talk about the events in her life which may be upsetting her.

16. Encourage her to relate what she is feeling to her family relationships and past experiences.

17. Encourage her to talk about her difficulties in be-havioral terms.

18. Use a nonverbal procedure to explore the rich emotional experience of crying.

19. Ask her to role play the situation which her crying is about.

Situation 15: the grumpy group

Meeting seven is characterized by a general mood of irritability and negativism. A person can hardly start talking before another interrupts to say that he is bored. No one seems pleased about anything. The warm involved mood at the end of the previous meeting seems completely forgotten. What do you do?

1. Do nothing.

2. Ask if they are satisfied with how the group is going today.

3. Reassure them that most groups have occasional meetings like this one.

4. Try to emphasize more positive feelings, both in your own remarks and those of others.

5. Suggest that they use the time more constructively.

6. Describe them as a group of irritable old men.

7. Ask how they feel about the meeting.

8. Say how you are feeling.

9. Share a similar experience in your own life.

10. Ask why everyone is being negative.

11. Ask what they think might be going on in the group today.

12. Describe the group's mood of negativism and irritability.

13. Say that there seems to be an unspoken understanding among the members to disagree with everything.

14. Describe their irritability as a reaction to the warm involvement of the previous meeting.

15. Encourage them to relate their grumpy mood to what is happening in their lives outside the group.

16. Encourage them to relate their behavior to their family relationships and past experience.

17. Encourage them to use this situation to consider behavior they may wish to change.

18. Use a nonverbal procedure to get at the underlying feeling.

19. Use a role playing or psychodrama procedure.

Situation 16: the polite group

The eighth meeting begins in a mood of superficial agree-ableness. Everyone is being super polite. Rambling remarks, evasive comments, behavior which ordinarily would immediately be challenged is being tolerated. It is clear that the group is protecting itself against any possible expression of aggressive feeling. What do you do?

1. Do nothing.

2. Ask if they are satisfied with how the group is going today.

3. Join in on whatever they are discussing.

4. Try to draw them into a more meaningful discussion.

5. Suggest that they get down to real feelings.

6. Be aggressive yourself--criticize the group for pussy-footing around.

7. Ask how they feel about what has been going on.

8. Say how you are feeling.

9. Share similar experiences in your own life.

10. Ask why everyone is being so polite.

11. Ask what they think might be going on in the group today.

12. Describe the group mood of politeness.

13. Say that there seems to be an unspoken agreement among the members to be polite and avoid anything that might rock the boat.

14. Suggest that all this politeness is a reaction against the anger of the previous meeting.

15. Encourage them to relate this to what is happening in their lives outside the group.

16. Lead into a discussion of their family relationships and past experiences.

17. Encourage them to use the situation to consider behavior they may wish to change.

18. Use a nonverbal procedure to get at the underlying feeling.

19. Use a role playing or psychodrama procedure.

Situation 17: a group attack

Throughout the meetings one of the men had been insisting that he has no problems. In the middle of this eighth meeting, the group attacks him for "hiding behind a mask". At the present moment, the whole interaction seems to be gaining in intensity--he responds to their accusations by increasing his denial; they respond to his denial by increasing their attack. You are not sure how he is being affected by it. What do you do?

1. Do nothing.

2. Even if they ask for your advice, let whatever happens happen.

3. Say that each person has the right to be the kind of person he wants to be.

4. Direct attention away from their attack by bringing up another issue.

5. Say that he is not going to get anything out of the group if he does not put anything into it.

6. Join in on the attack.

7. Ask how he feels about what they are saying and how they feel about what he is saying.

8. Say how you are feeling.

9. Share an experience in your own life.

10. Ask why they are attacking and why he is denying.

11. Ask what they think might be going on in the group today.

12. Comment on the intensity of the argument between him and the rest of the group.

13. Describe the interaction as a standoff--they respond to his intellectualizing with increased attack and he responds to their attack with increased intellectualizing.

14. Describe his denial as resistance to becoming involved in the group and descdibe the group's attack as an attempt to force him to become involved.

15. Ask if the kind of thing happening in the group now ever occurs in his life outside the group.

16. Encourage him to relate these group events to his family relationships and past experiences.

17. Encourage him and the others to use this event to con-
    sider behavior they may wish to change.

18. Ask him and the others to express nonverbally how they
    feel toward each other.

19. Suggest that he and another member role play each
    other's side in the argument.

Situation 18: a member comes drunk

A man who has been relatively quiet in the two previous
meetings comes to session nine drunk. He is mildly disrup-
tive, laughing and singing to himself, and occasionally
breaking in when others are talking. What do you do?

1. Do nothing.

2. Ask what they want to do about the situation.

3. Show interest in him and express concern about his dif-
   ficulties (say that he must have been feeling pretty
   lonely and depressed).

4. Continue as if nothing out of the ordinary were happen-
   ing.

5. Ask him to leave and come back when he isn't drunk.

6. Accuse him of behaving like a baby.

7. Ask how they feel about what is happening.

8. Say how you are feeling.

9. Share a similar experience in your own life.

10. Ask him why he came to the meeting drunk.

11. Ask how they would describe what has been going on in
    the meeting.

12. Describe his effect on the mood of the group.

13. Suggest that he may be trying to tell the group
     something that he could not say in other words.

14. Describe his behavior as an expression of anxiety about
     what has been happening in the group.

15. Encourage him to talk about the events in his life
     which may be troubling him.

16. Encourage him to relate his behavior to his family
     relationships and past experiences.

17. Encourage him to talk about his difficulties in
     behavioral terms.

18. Ask him to express nonverbally how he feels about you
     and the others.

19. Ask another member to role play the drunk member's
     behavior.

Situation 19: a side conversation

The group had been spending much of this ninth meeting
talking about one of the women, when another woman turns to
a man sitting next to her and, disregarding the main conver-
sation, starts a competing side conversation. Her talking
is a discourtesy and interferes with the main discussion.
She continues for several minutes and gives no sign of
stopping. What do you do?

1. Do nothing.

2. Ask why no one has said anything about the two conversations.

3. Talk in an approving way about the engaged, intense, and spirited quality of the group interaction.

4. Draw her into the main discussion by inviting her to tell the whole group what she is talking about.

5. Ask that there be only one conversation at a time.

6. Say that it sounds like a nursery school--everyone wants to talk and no one wants to listen.

7. Ask how they feel when there are two conversations going on.

8. Say how you are feeling.

9. Share a similar experience in your own life.

10. Ask her why she is starting a second conversation.

11. Ask how they would describe what has been going on.

12. Say that there are two conversations going on.

13. Describe her side conversation as an expression of jealousy.

14. Describe her interruption as the expression of an underlying fear of being ignored and abandoned.

15. Encourage the interrupting member to talk about herself (perhaps her behavior is a reflection of difficulties she is having in her life outside the group).

16. Encourage her to relate these group events to her family relationships and past experiences (perhaps she felt left out in her family).

17. Encourage her to use this event to consider behavior she may wish to change.

18. Ask her to express nonverbally how she feels toward each person.

19. Ask them to exchange roles and repeat the interaction.

Situation 20: the fight

Later in this ninth session, two men get into a heated argument over a minor point. The real reason for the argument appears to be their rivalry for the attention of one of the women. Finally one of the men jumps up enraged and threatens to hit the other. What do you do?

1. Do nothing.

2. Ask the members what they want to do about the situation.

3. Comment on the willingness with which these men are able to accept their aggressive feelings.

4. Defuse the situation by redirecting the group's attention to another issue.

5. Say that physical violence is not allowed in the group.

6. Tell him to sit down, shut up, and stop acting like a child.

7. Ask about feelings (examples: ask the two men and the women how they feel about each other; ask the members how they feel about what is going on).

8. Say how you are feeling.

9. Share a similar experience in your own life.

10. Ask the two why they are doing what they are doing.

11. Ask what they think might be going on between these two men.

12. Describe the mood of tension in the group.

13. Attribute the argument to competition between the two men for the attention of this woman.

14. Describe his aggressive behavior as a defense against his more passive and dependent feelings.

15. Encourage the threatening member to talk about himself (perhaps his behavior is a reflection of difficulties he is having in his outside life outside the group).

16. Encourage him to relate these group events to his family relationships and past experiences.

17. Encourage him and the rest of the group to use this event to consider behavior they may wish to change.

18. Use a nonverbal procedure (example: arm wrestling).

19. Ask other members to role play the interaction between the two men.

Situation 21: the sexualized meeting

The tenth meeting begins in a mood of seductiveness. At the center of the interaction is a girl who, for several meetings now, has repeated a pattern of flirting with a man until he begins to show interest in her. In the present meeting, she has just stopped flirting with one man and has begun with another. Everyone seems to be taking part in

the sexual mood, if not as an active participant, at least
as a fascinated observer. What do you do?

1. Do nothing.

2. Ask if they are satisfied with how the group is going
   today.

3. Talk in an approving way about the intensity with which
   everyone seems to be involved.

4. Seeing the interaction as a stalemate, lead the group
   in another direction.

5. Suggest that they talk about what is going on rather
   than simply continuing to do it.

6. Accuse her of being a flirt who is basically afraid of
   men.

7. Ask about feelings (examples: ask the three major
   participants how they feel about each other; ask the
   members how they feel about what is going on).

8. Say how you are feeling (example: fascinated).

9. Share a similar experience in your own life.

10. Ask her why she is flirting the way she is.

11. Ask what they think might be going on among these three.

12. Describe the mood of seductiveness in the group.

13. Describe how the whole group seems to be fascinated by
    the interaction among the three.

14. Suggest that she flirts with different men because she
    is afraid of involvement with any one.

15. Ask if this is the way she relates to men outside the
    group.

16. Encourage her and the others to relate these group
    events to their family relationships and past experiences.

17. Encourage them to use this event to consider behavior
    they may wish to change.

18. Ask them to express nonverbally how they feel about
    each other.

19. Suggest that the three change roles and repeat the
    interaction.

DEFINITIONS OF THE NINETEEN GROUP LEADERSHIP
SCALES OF GROUP THERAPY QUESTIONNAIRE-C

1. Silence, O: the leader does nothing; he remains silent.

2. Group Directed, GD: the leader appeals to the group as
   the leadership agency. He indicates that the steward-
   ship of the group and the management of problems which
   arise in the group are the responsibility of the group.
   GD consists of two types of responses: a relatively
   unchallenging abdication of leadership and a relatively
   challenging insistence on the responsibility of the
   group.

3. Reassurance-Approval, RA: the leader supports, comforts,
   compliments, or expresses reassurance, approval, respect,
   agreement, acceptance, liking, concern, sympathy, or
   empathy.

4. Subtle Guidance, SG: the leader guides the group in a
   nonconfronting or indirect manner. When situation,
   particularly difficult situations, arise in the group,
   he does not make an issue about them, but either
   ignores them or unobtrusively redirects the attention
   of the group in a different direction.

5. Structure, S: the leader structures the group meeting.
   He makes rules, sets limits, or indicates how the group
   might best proceed.

6. Attack, A: the leader is aggressive and provacative,
   criticizing the group (or a member) in a more or less
   decisive manner. He accuses, chides, insults, ridicules,
   makes fun of, undercuts defenses, or caricatures.

7. Member Feelings, MF: the leader asks members to say how
   they are feeling or reactint to what is going on.

8. Leader Feelings, LF: the leader expresses his own feelings.

9. Leader Experience, LE: the leader tells the group about
   experiences he has had which are related to what is
   foing on in the group.

10. Clarification-Confrontation Question, CQ: the leader asks
    members why they are doing what they are doing. Depend-
    ing upon manner and context of this response, the effect
    could be either an invitation to clarify or a challenge
    to justify.

11. Group Dynamics Question, GQ: the leader encourages the members to step back from the immediate situation and examine what is happening from a wider perspective, i.e., taking into account underlying dynamics.

12. Group Atmosphere, GA: the leader describes what is going on in the group, but with a minimum of interpretation and inference. He describes the mood in the group as he is sensing it or draws attention to individual group events which, while not hidden, are being overlooked or disregarded. GA is the first of three categories in which the leader tells the group what he thinks is going on; the remaining two, GI and PI, are more ambitious and more clearly interpretative statements.

13. Group Dynamics Interpretation, GI: the leader interprets the underlying group interaction. His focus in the interpretation is on what is happening in the group as a whole. In situations which involve the activity of only one of the members, the leader interprets this member's behavior in relation to, as a function of, or in the context of, the rest of the group.

14. Psychodynamic Interpretation, PI: the leader interprets events and behavior in terms of the psychodynamics of the individual members. Their behavior is interpreted as resistance or defense, as a manifestation of anxieties, guilt or anger, or as a reaction to specified preceding events. Since many psychodynamic interpretations are also psychodynamic interpretations, GI and PI are not always clearly distinct from each other.

15. Personal Life, PL: the leader encourages members to talk about themselves as individuals separate from the group. If members are talking about themselves or about their lives outside the group, he encourages them to continue; if they are talking about the group or about themselves in the context of the group, he encourages them to talk about themselves as individuals distinct from the group.

16. Past and Parents, PP: the leader encourages members to talk about the significant events in their past lives and about their relationships with their parents and siblings.

17. Behavioral Change, BC: the leader encourages members to consider (discuss and specify) those aspects of their behavior which they may wish to change.

18. Nonverbal, NV: the leader initiates a nonverbal procedure of some kind.

19. Role Playing, RP: the leader initiates a role playing or psychodrama procedure of some kind.
